Trade with Axiom Pro :

Axiom

The Gateway to DeFi

https://axiom.trade/@rexblack

Welcome to the most comprehensive memecoin trading system ever developed (it is for real ?).

This isn't theory—it's battle-tested strategies that have generated almost six figures in profits during the past months.

What you're about to learn:

- Why 99% of memecoin traders fail (and how to join the profitable 1%)
- A complete system for finding, analyzing, and profiting from memecoins
- Psychological frameworks that transform how you approach trading
- Risk management techniques that professionals use to protect capital & compound gains

Who this is for:

This book is designed for those serious about generating wealth in the memecoin market—not get-rich-quick dreamers.

Whether you're starting with **$100** or **$10,000,** these principles scale with your capital.

I didn't start with hundred of thousands of capital.

I'm not a professional trader, I was a normal guy before crypto and my goal is to show you for **FREE** how to do it.

If you cannot focus and read this full guide then you're never going to make money. If

you really want to make it, read this guide, then read it again and take notes.

What makes this different:

Unlike most crypto courses that focus on "fundamentals", I focus on what actually drives memecoin prices: attention economics, psychological triggers, and precise entry/exit timing.

I’m not coming with fantasy number and i’m the proof that anyone can succeed even starting with 100$.

Throughout this course, you'll receive immediate actionable techniques at the beginning of each module—techniques you can implement in minutes for rapid results. Then we'll dive deeper into the underlying principles.

Remember ⚠️ :

In the memecoin market, the difference between success and failure isn't luck. It's a systematic approach to identifying opportunities, understanding human psychology, managing risk, and maintaining discipline.

Let's begin your transformation from hopeful trader to consistent winner.

(This guide is educational content only. Always conduct your own research and trade at your own risk.)

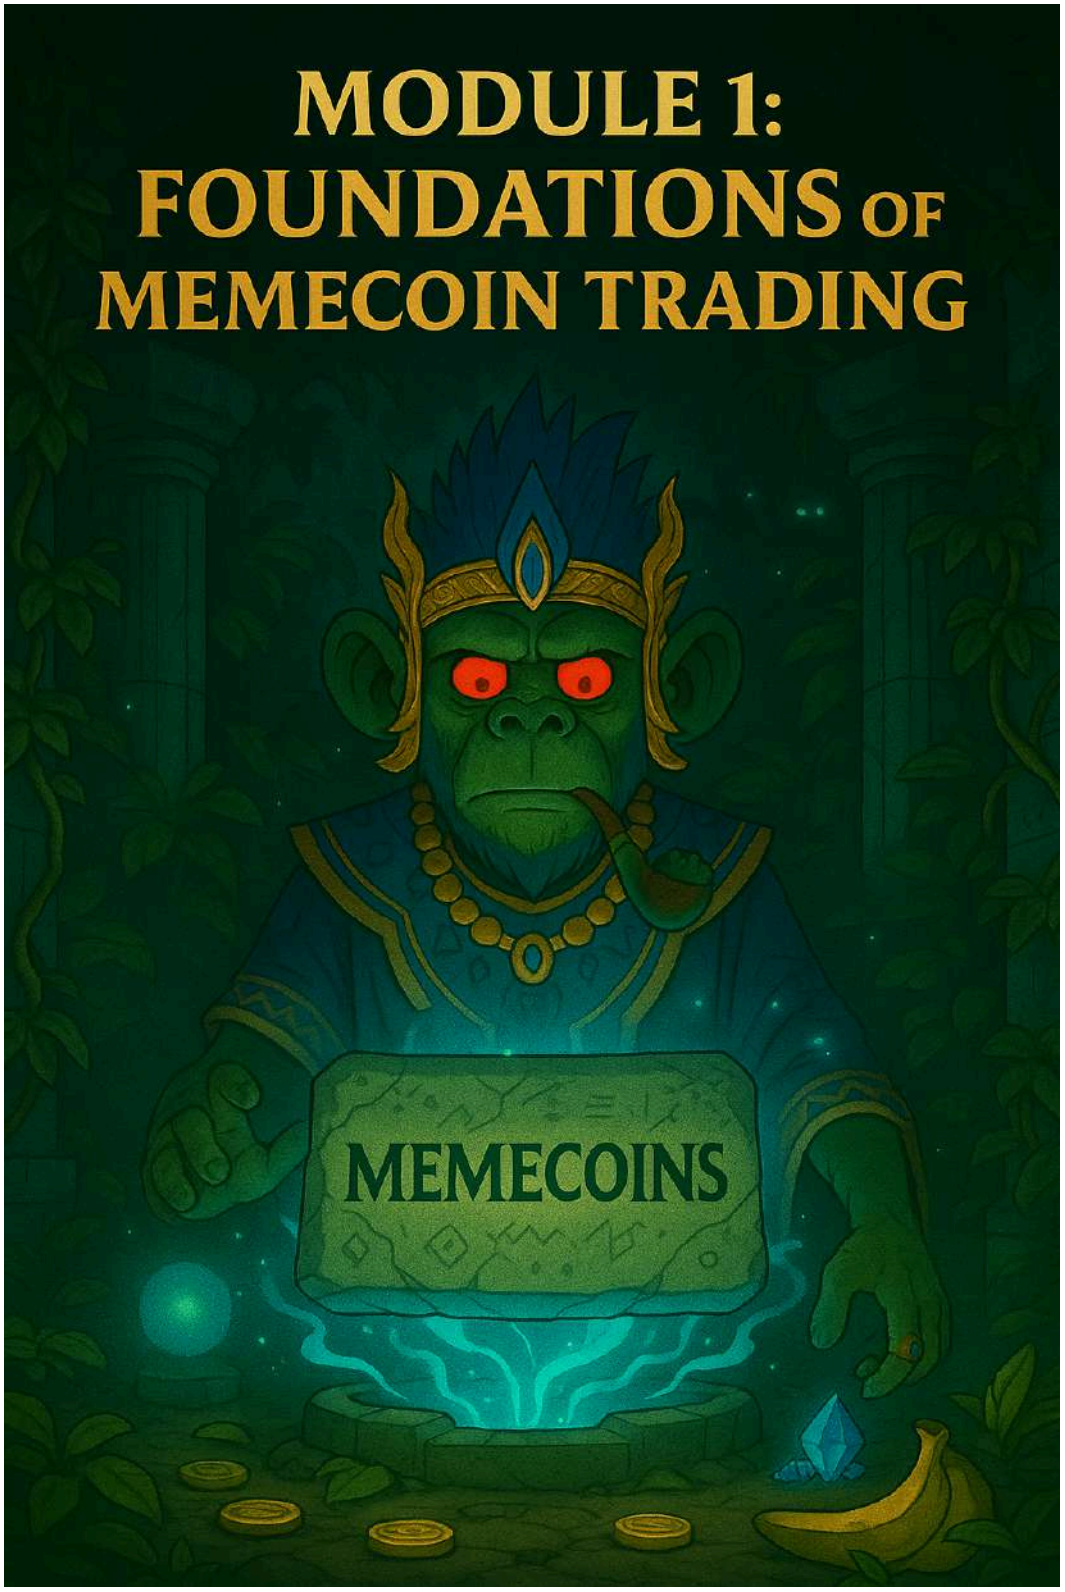
💡 What's Action Items ?

📍 Complete these tasks before moving to the next module
📍 Each task builds your real-world trading foundation
📍 Check them off as you complete them

- ☐ Action 1: Specific, results-focused task
- ☐ Action 2: Quick-win application of module knowledge
- ☐ Action 3: Preparation for next module

(if you don’t understand some terms refer you to the glossary)

▼ MODULE 1 : Foundations of Memecoin Trading 🎓



MODULE 1:
FOUNDATIONS OF
MEMECOIN TRADING
MEMECOINS

> *"Most traders skip this step. That's why you're not most traders."*

Quick Win Technique:

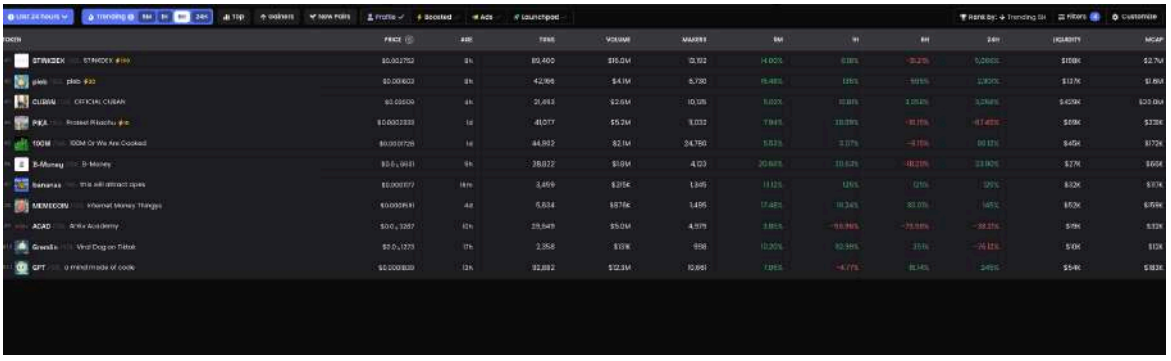
Open DEX Screener right now and set these filters:

Solana DEX Screener

Realtime Solana price charts and trading history

https://dexscreener.com/solana

- Tokens under 12 hours old
- Dex → Pump Swap only
- Minimum $5K liquidity
- 5M Volume : 10 000
- 5M Change: 1%
- Enable "Profile."
- Sort by volume in 5 min.



If any token showing >5% holder growth in the last hour with no wallet owning more than 5% of supply is in the "early hype phase" - the perfect entry point for maximum gains.

You just learned in 30 seconds how to identify potential 10x opportunities before they trend. 🤑

What You'll Learn in Module 1

- The true nature of memecoins as attention-driven assets (not technology-driven)
- Why Solana has become the premier blockchain fot memecoin trading
- How to recognize and profit from each phase of the memecoin lifecycle
- Setting realistic risk/reward expectations based on actual market data

Why This Matters:

Understanding what truly drives memecoin valuations prevents you from making catastrophic mistakes that plagne 95% of new traders.

MODULE 1 : Foundations of Memecoin Trading 🎓

> “Welcome to the jungle—where fortunes bloom overnight and die before sunrise.”

▼ **1.1 - What are memecoins**

What Are Memecoins? (The No-BS Guide)

Let me tell you something right now - memecoins aren't just random tokens, they're psychological experiments wrapped in cute dog pictures and funny memes.

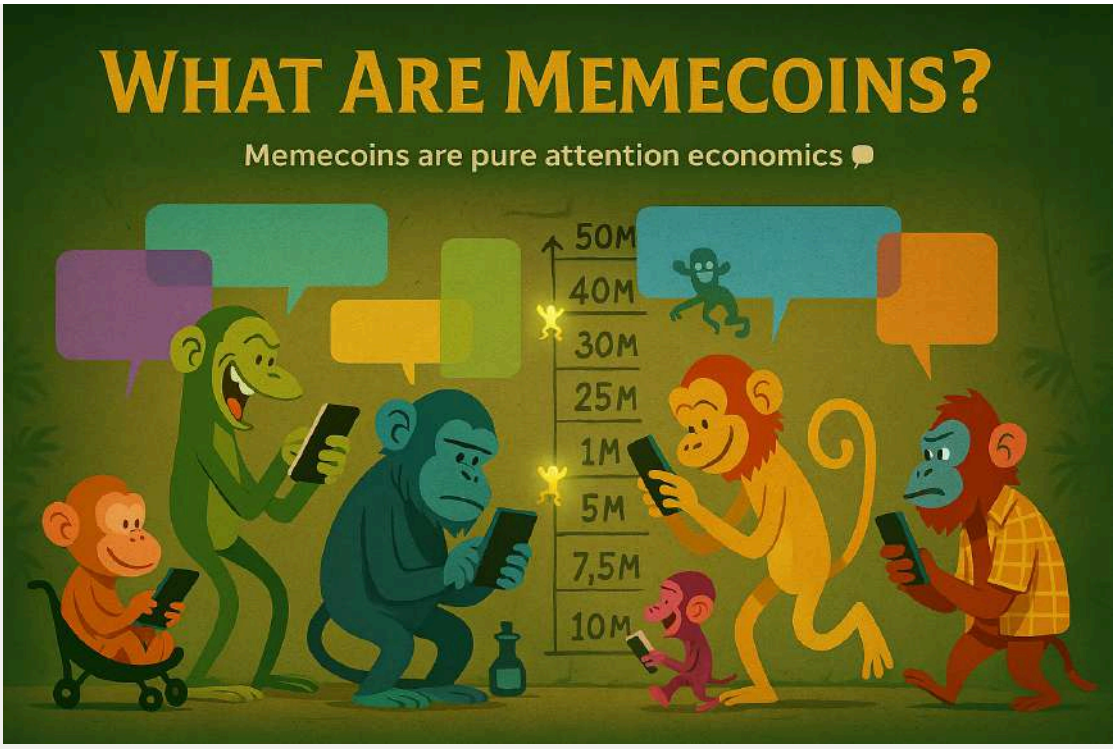
Believe me when I say this isn't just another crypto trend - it's a whole new game.

Memecoins have NOTHING to do with technology, utility, or solving real-world problems. That's corporate BS companies sell you & people are tired of that.

Memecoins are pure attention economics. 📱👀

The more eyes on a coin, the higher it goes. It's that simple.

If you're coming into this space thinking about "fundamentals" or "utility" - drop that thinking right now. - You're playing the wrong game with the wrong rules.



The Truth About What Makes Memecoins Valuable

You want to know what actually gives a memecoin value? It's not the tech. It's:

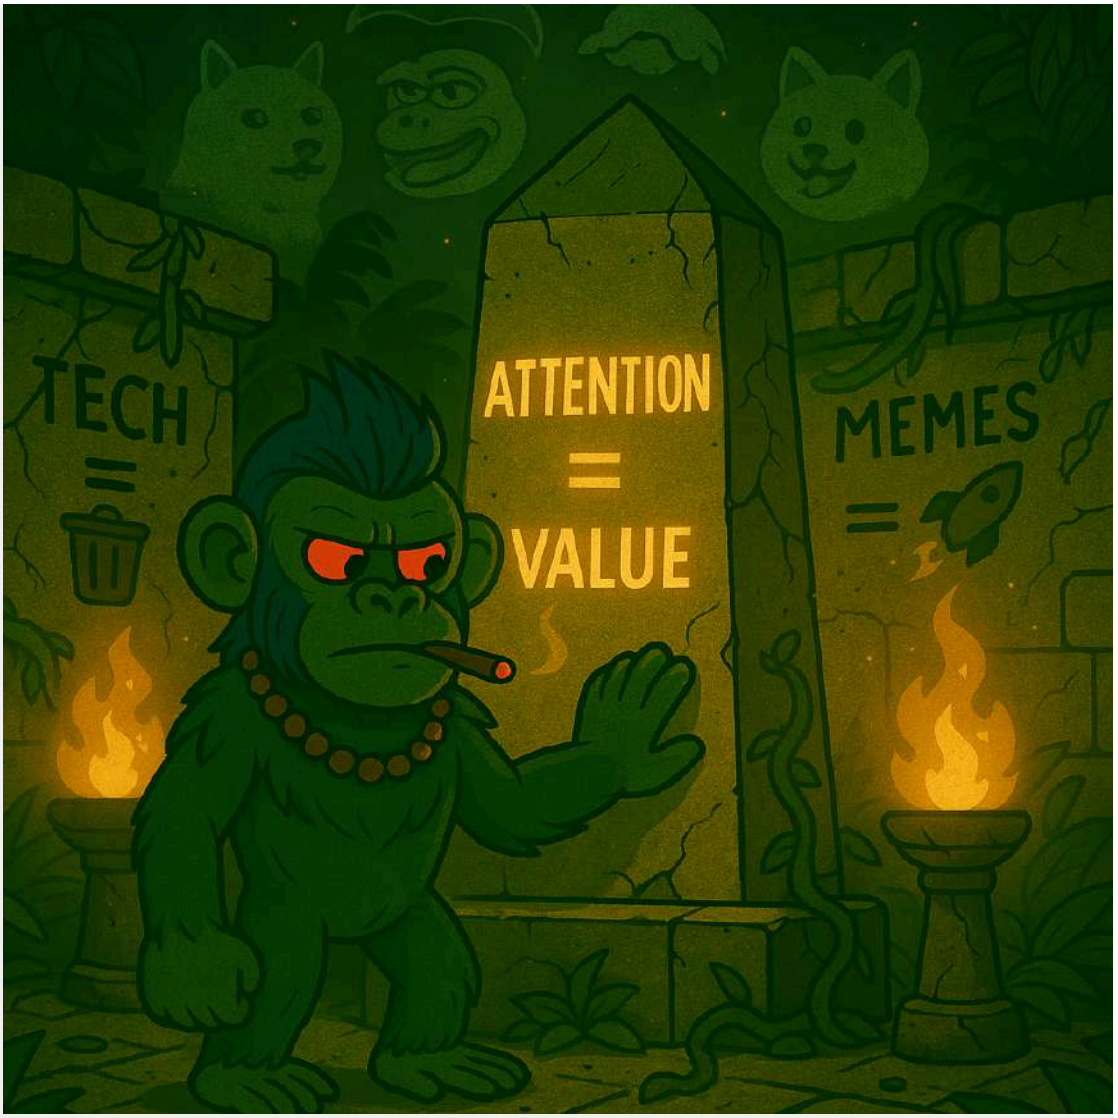
> **Community, Culture & Energy**: A memecoin with 10,000 believers will outperform one with better "tech" every single time.

> **Viral Potential**: Can normal people explain it in one sentence? Can it spread like wildfire on TikTok? This is what matters.

> **Emotional Response**: Does it make you laugh? Does it connect to something trending? This drives buying more than any whitepaper.

> **Accessibility**: Can anyone with $10 and a phone buy it? Low barriers = more buyers = higher price.

I was trading coins back when pumpfun didn’t even exist. Trust me - I've seen what works and what fails.



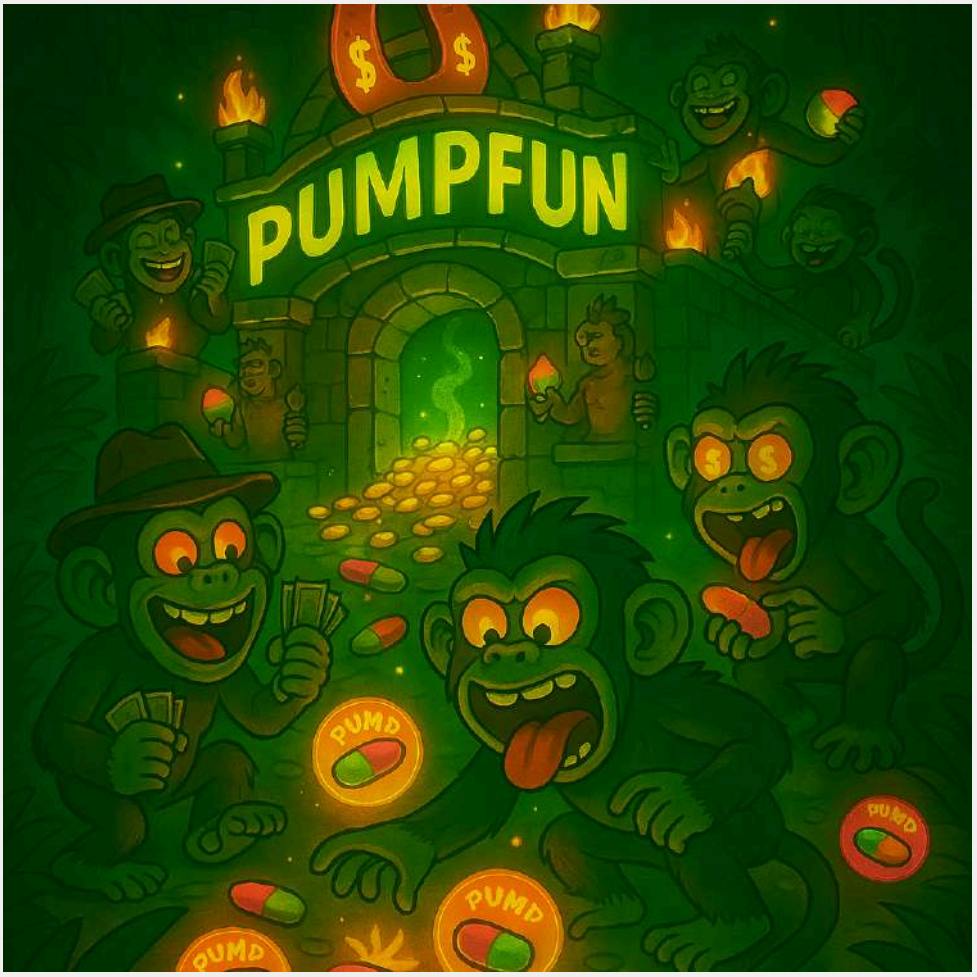
Memecoins are here to stay. Why ? Because it’s the first way to bring the attention on chain. We all dreamed about tokenized a tweet that went viral ... well ... pumpfun did it !

Pumpfun understood this and created the biggest casino in the world history.

Pump.fun

From one side :

- Gamblers are attracted for high gain expectations



From the other side:

- Lonely people seek for coin with a community they can consider as their family. This happen when some people found themselves finding other people sharing the same values (memes are good véhicule from that)

Since Covid, it's now more okay to remain sedentary and have only online friends with an increase of people joining micro communities since the lockdown.

💡 In short terms: Memecoins have the best utility = Emotional utilty

Why 99% of Regular People Make Money in Memecoins (Not "Serious" Crypto bros)

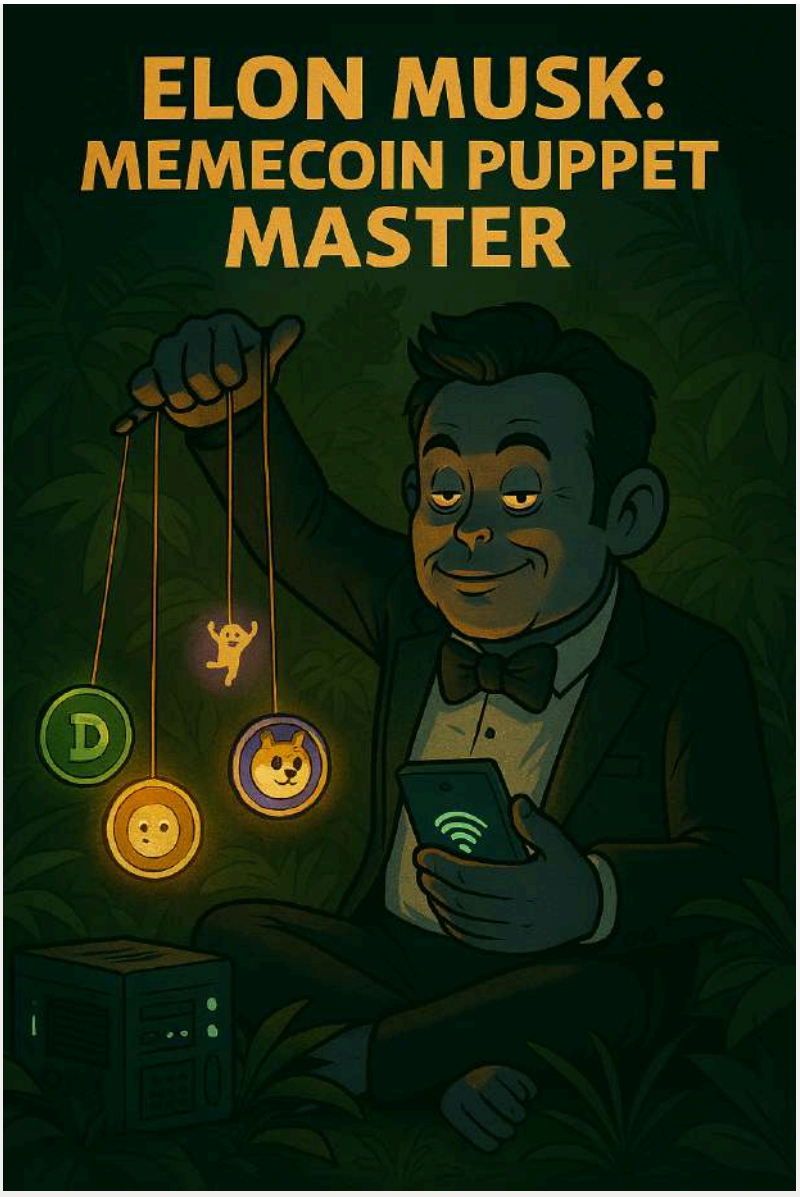
Regular crypto ETH boomer tries to be complicated. They WANT you to feel stupid so you'll trust their "experts."

Memecoins? Everyone gets them. Your 16-year-old cousin understands $MOODENG better than most "experts" understand blockchain technology.

That's why we've seen kids turn $20 into $50,000 while PhDs are crying about their "blue chip" or alt coins being down 70%.

It's not about being smart. It's about understanding human psychology. 🧠

When Elon Musk tweets a dog picture, nobody's asking about transaction throughput or decentralized governance. They're aping in because they know OTHER PEOPLE will ape in.



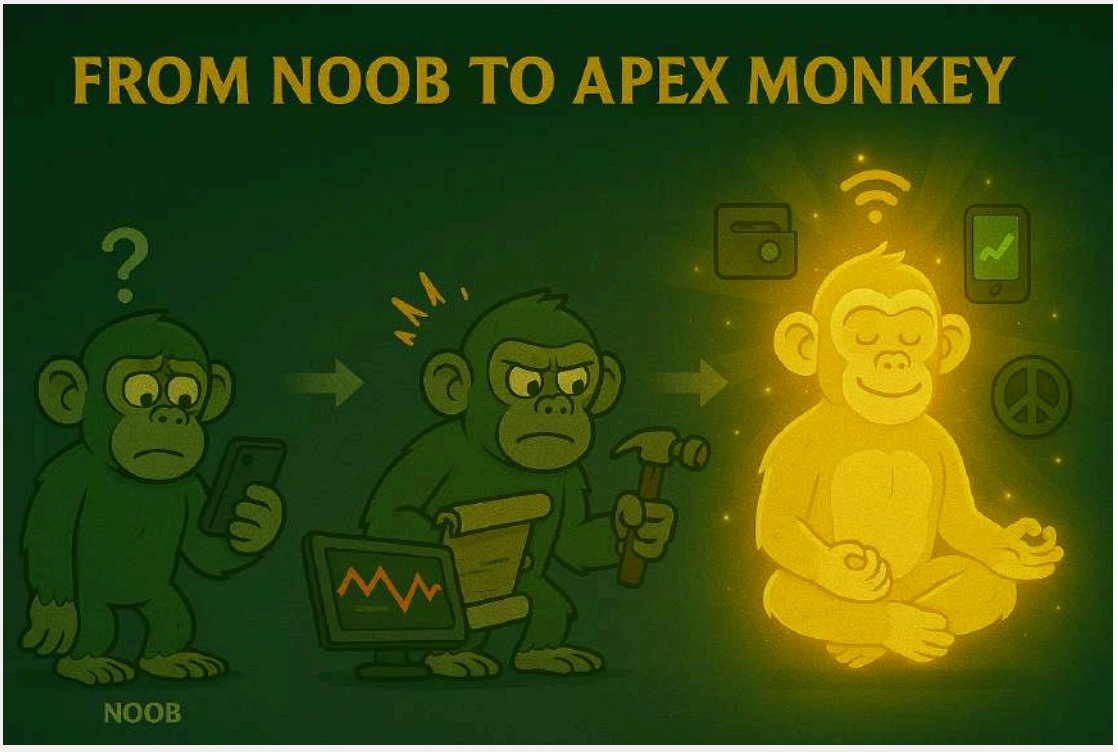
This is why most "serious crypto bros" miss all the gains. They're too busy analyzing something meaningless while ignoring what actually moves markets - ATTENTION.

You bet on the fact that the news/meme will get viral or not.

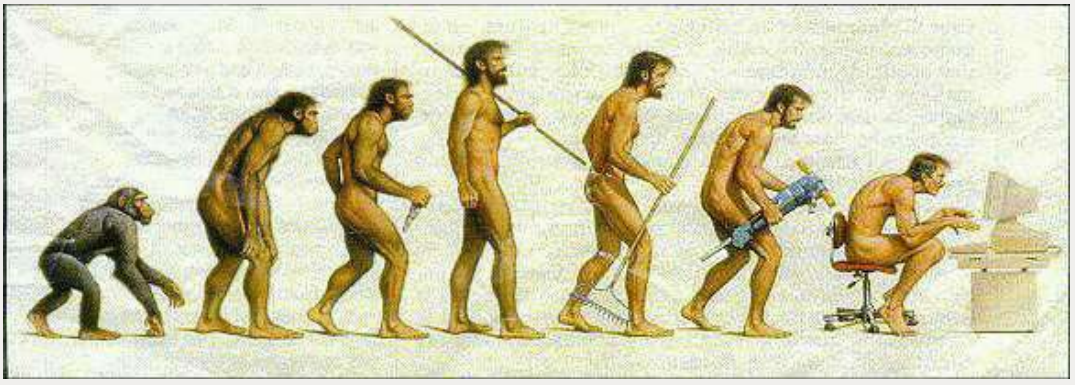
From Zero to Memecoin Profits - The Mindset Shift

If you're going to succeed here, you need to transform:

- From the researcher to the trend-spotter.
- From the analyzer to the quick-mover.
- From the overthinker to the action-taker.



I wasn't born knowing this stuff. I had to UNLEARN everything the traditional & nft trading world taught me.



You can study charts for years and still get destroyed by someone who simply understands that when a black devil anglerfish or a killed squirrel goes viral on TikTok, there's a coin that's about to pump.

This isn't investing. This is surfing waves of human attention. 🤳

And in the next part of this guide, I'm going to show you exactly how to start catching these waves before most people even know they're forming.

Remember - people who approach memecoins with a broke mindset will always lose. People who understand the psychology of attention will always win.

The choice is yours - stay stuck in old thinking or evolve and profit.

Stay alive in the trenches ! 🪖

▼ **1.2 - Why Solana is Ideal for Memecoins trading**

Why Solana is Ideal for Memecoin Trading

Solana has emerged as the premier blockchain for memecoin trading for several key reasons:

> **Ultra-low fees**: Transactions cost fractions of a cent, allowing frequent trading without fee erosion

> **Lightning-fast transactions**: 400ms finality means you can enter/exit positions almost instantly

> **Vibrant memecoin culture**: Tools like Pump.fun have created an ecosystem specifically for meme creation

> **High liquidity**: Active trading environment ensures you can enter/exit positions easily

These advantages create a perfect environment for the fast-paced nature of memecoin trading, where timing and cost-efficiency are crucial.

Fee Comparison: Why It Matters

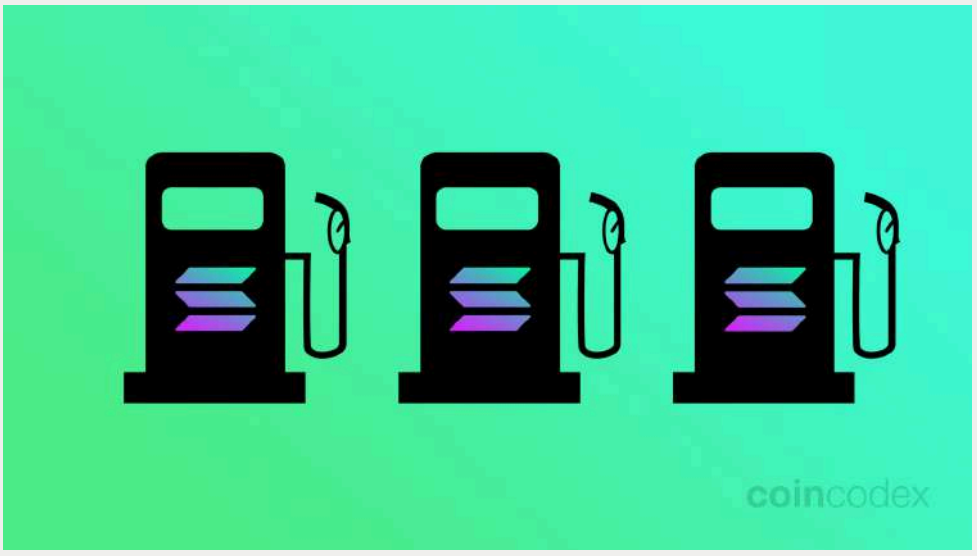
When trading memecoins, fees directly impact your profitability:

Blockchain	Average Transaction Fee	Cost of 10 Trades	Cost of 100 Trades
Solana	$0.00025	$0.0025	$0.025
Ethereum	$5-20	$50-200	$500-2000
BSC	$0.20-0.50	$2-5	$20-50

Real Impact: Trading 100 times on Solana costs less than a single trade on Ethereum.
This allows you to:

> Enter positions early with minimal capital

> Average into positions through multiple buys
> Exit positions partially to secure profits
> Rebalance your portfolio frequently



Transaction Speed: The Edge in Volatile Markets

Memecoins can pump 50-300% in minutes. Speed determines whether you catch these moves:

- Solana (400ms): Orders execute almost instantly
- Ethereum (5-10 min): Often miss entry/exit points during high volatility
- BSC (5-15 sec): Better than ETH but still misses rapid price movements

Practical Application: When $BONK pumped 800% in one day, traders could enter and exit multiple times on Solana, maximizing profits on each volatility wave.

Key Trading Tools on Solana

The ecosystem has evolved specifically for memecoin trading:

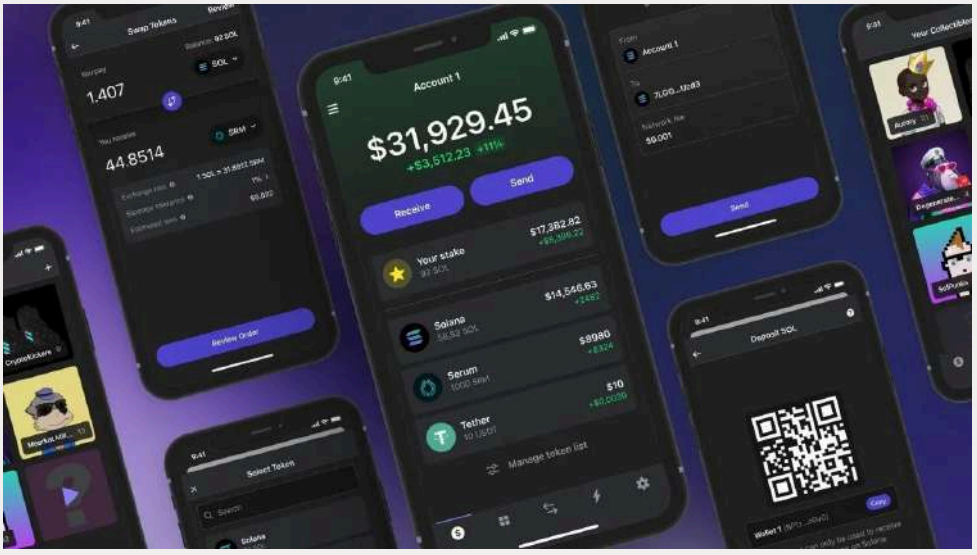
- **Pump.fun**: One-click token creation and trading interface

- **BullX/Axiom Pro**: Advanced trading features including limit orders and stop losses

BullX

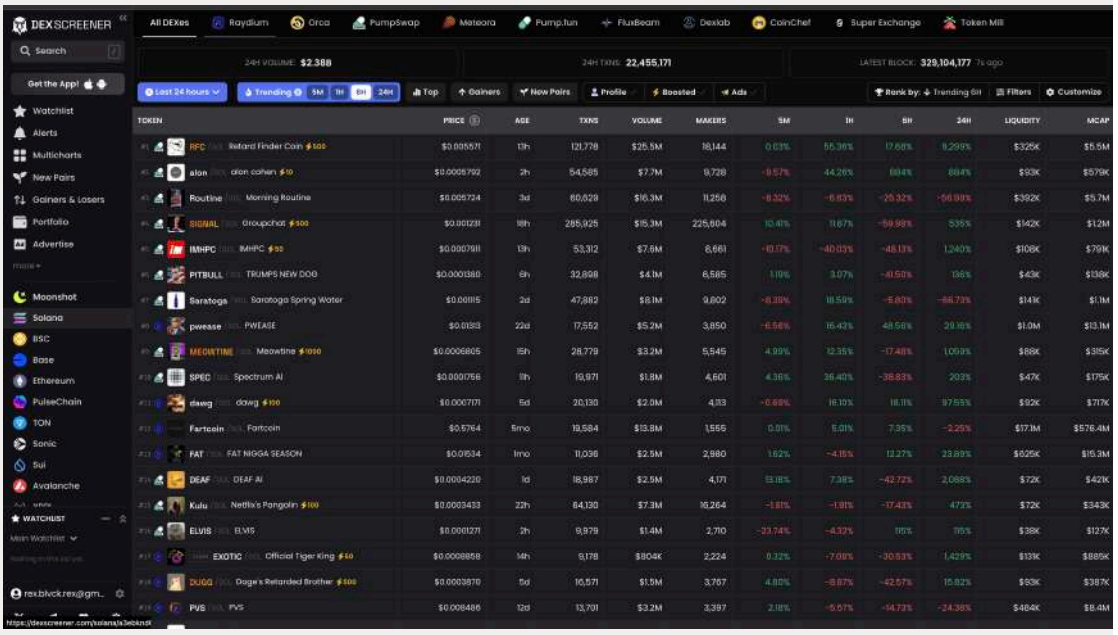
AXIOM Pro

- **Phantom Wallet**: User-friendly mobile and browser wallet



- **Dexscreener**: Real-time charts and analytics

DEXSCREENER



Liquidity Advantage

Memecoin trading requires sufficient liquidity to enter and exit positions:

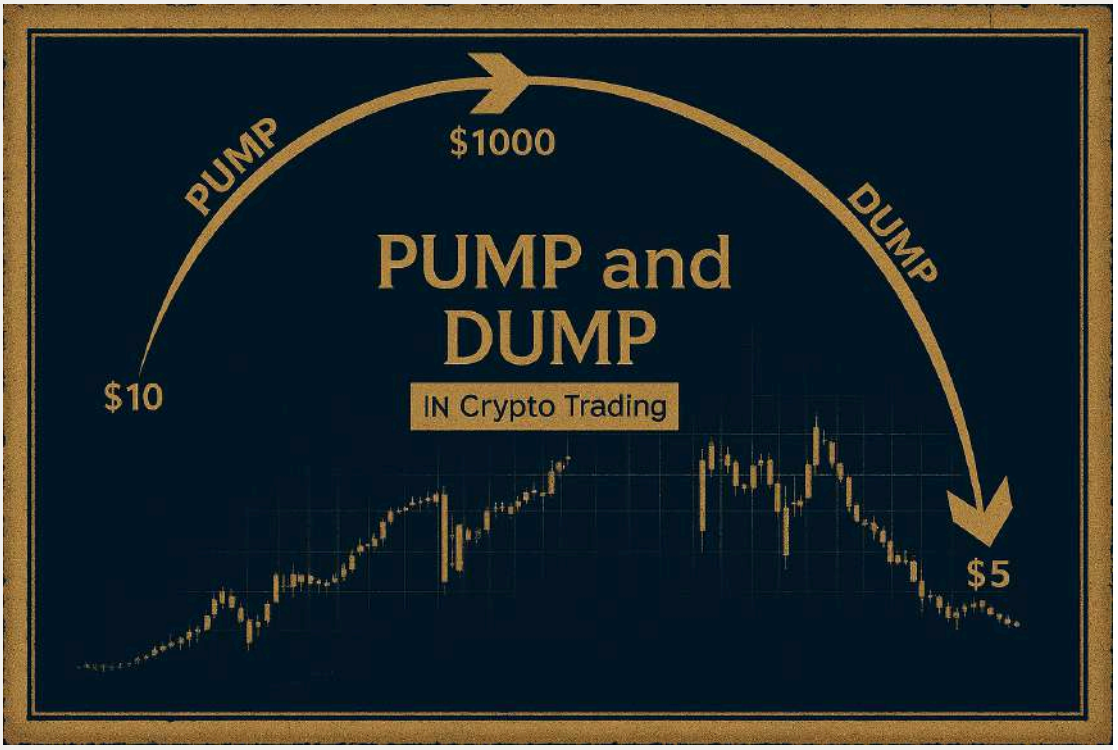
> Major Solana memecoins have $1M-$100M+ in liquidity
>
> Even new tokens typically launch with $5K-$20K liquidity
>
> Low slippage on trades under $1K (typically <2%)

Memecoin Trading Workflow on Solana:

```
1. Discover new token
→ 2. Research token fundamentals
→ 3. Enter position with minimal fees
→ 4. Monitor in real-time
→ 5. Exit full/partial position instantly when target reached
```

This entire process can happen within minutes on Solana, compared to hours on other chains.

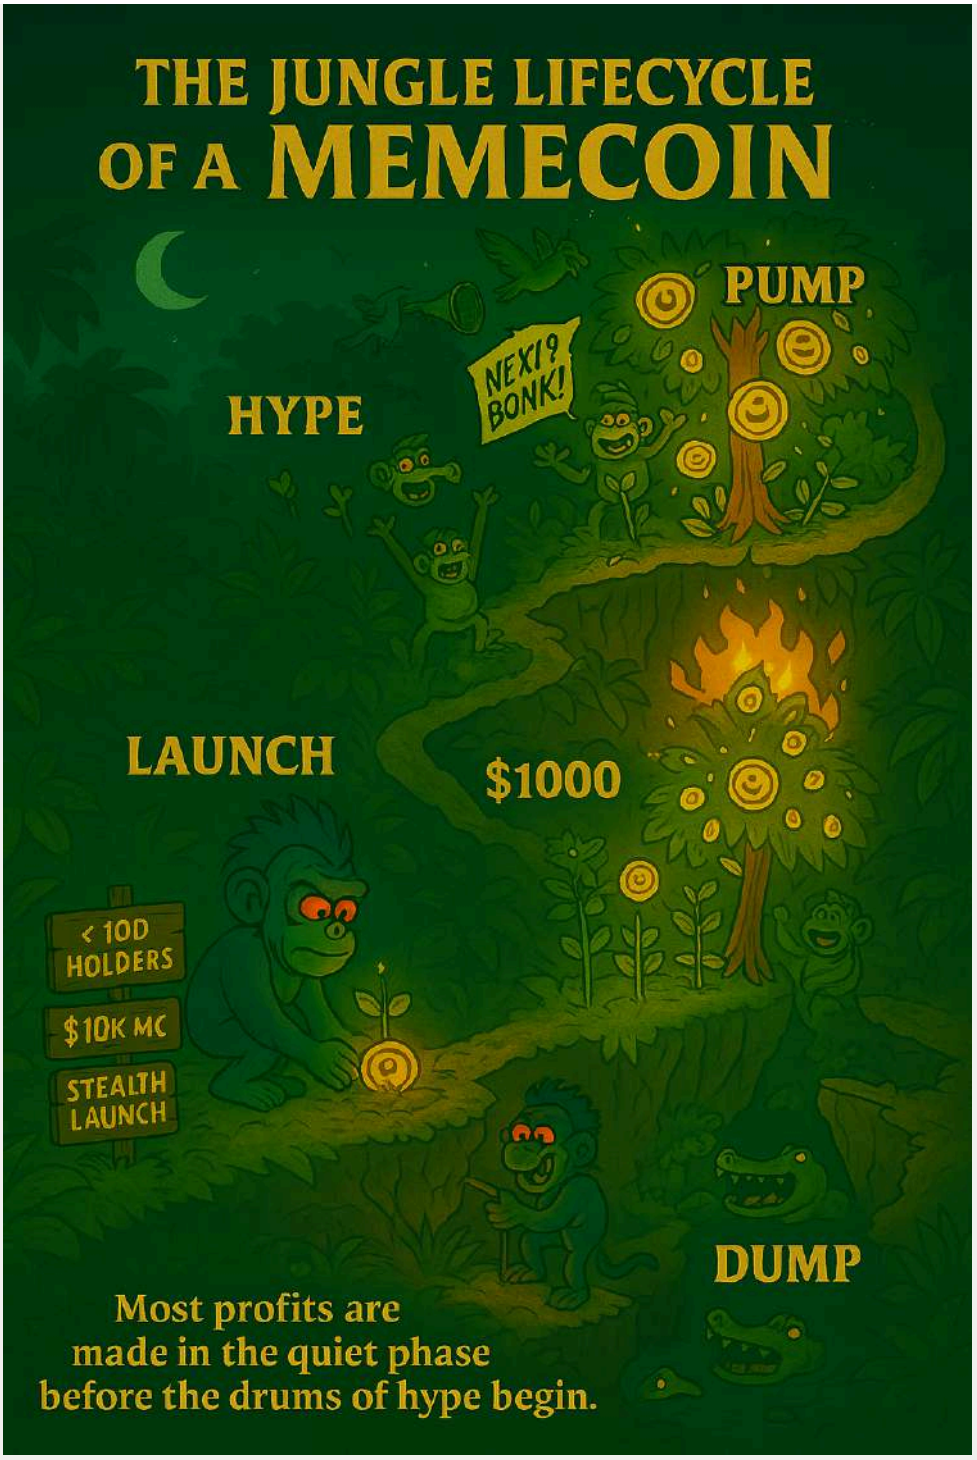
▼ 1.3 - Understanding Memecoins Market Cycles



Beware of the roundtripping syndrom

Every memecoin typically follows a predictable lifecycle:

1. **Launch**: New token appears with minimal holders and liquidity
2. **Hype**: Social media attention drives initial interest and price growth
3. **Pump**: FOMO kicks in, leading to parabolic price action
4. **Dump**: Early investors take profits, triggering rapid price decline



Recognizing which phase a memecoin is in determines your strategy. The most profit typically comes from identifying coins during the early hype phase before the major pump.

The 4 Phases in Detail

Phase 1: Launch

- **Indicators**:
  - Low holder count (<100)
  - Micro market cap ($10K-100K)
  - Minimal social presence
  - New listing on DEX Screener
- **Trading Strategy**: Only enter if you have insider information or strong conviction in the concept. Risk of failure is highest here.

Phase 2: Hype Building

- **Indicators**:
  - Growing social engagement
  - Increasing holder count (100-500)
  - Price up 50-200% from launch
  - Trading volume rising steadily
- **Trading Strategy**: Optimal entry point for maximum gains. Look for coins with genuine community growth and unique narratives.

Phase 3: The Pump

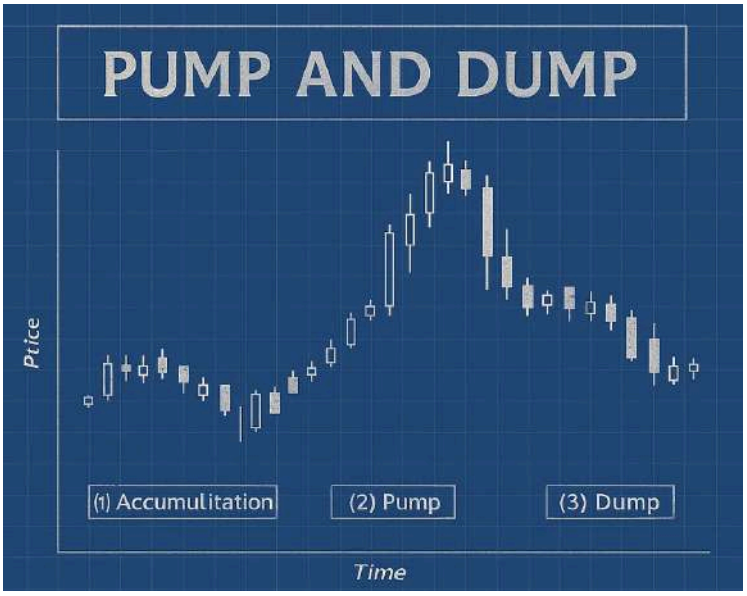
- **Indicators**:
  - Parabolic price action (200%+ in hours)
  - Explosive volume increase
  - Mentions by influencers
  - Rapid holder growth
- **Trading Strategy**: Begin taking profits in stages (25% at a time). Don't get greedy – most coins don't hold these gains.

Phase 4: The Dump

- **Indicators**:
  - Volume declining while price still high
  - Large sell orders appearing
  - Social sentiment shifting to "take profits"

    - Early holders (top wallets) reducing positions

- **Trading Strategy**: Exit remaining positions. Don't try to catch the exact top – aim to exit in the top 20% of the move.

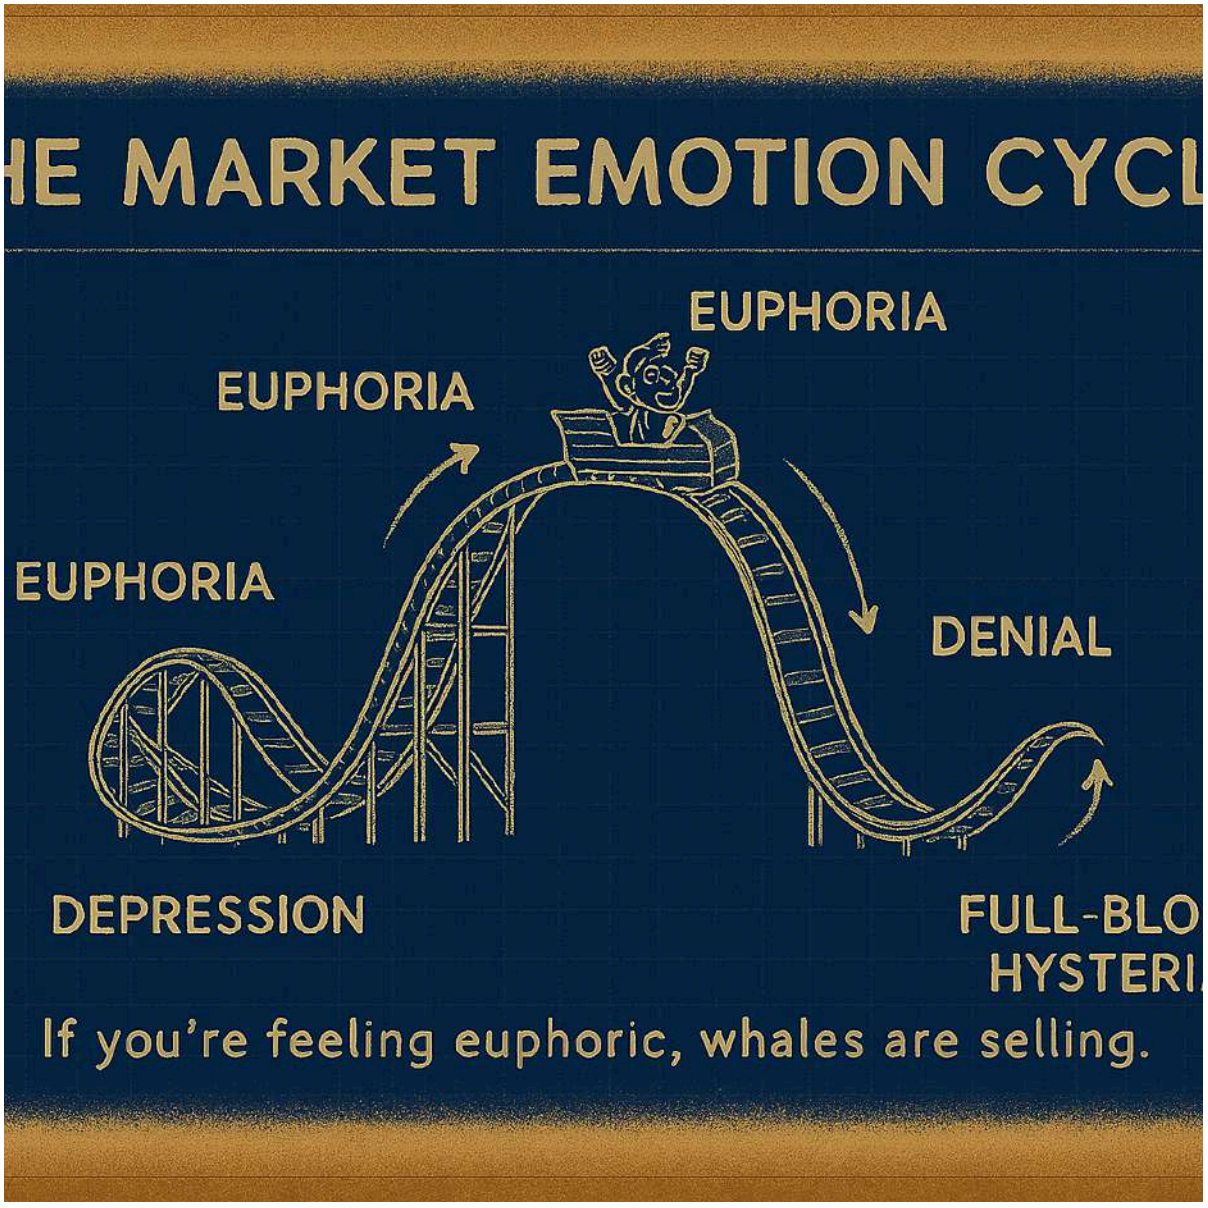


Most of the coins will die before reaching even 100k MC but if you catch a runner early you can make X10 in a matter of seconds.

Multi-Cycle Patterns

Most successful memecoins experience 2-3 major pump cycles:

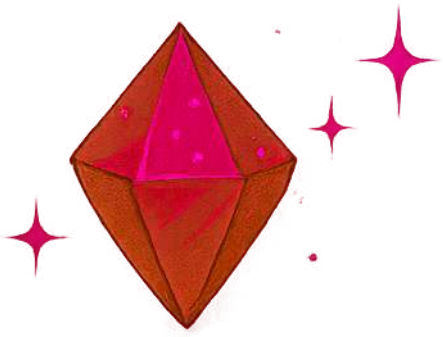
```
First Cycle:   Launch → Small Pump → Correction (40-60% drop)
Second Cycle:  Accumulation → Larger Pump → Larger Correction
Third Cycle:   Final Accumulation → Biggest Pump → Extended Decline
```



The key is identifying whether a coin has the fundamentals to survive the first correction and enter a second cycle. Look for:

> Strong holder retention during corrections
>
> Continued developer (if dev hasn't sold) or community activity
>
> Community growth even during price declines

(If dev sold and he's out of the project it's fine except fr an A.I project)



Practical Cycle Identification

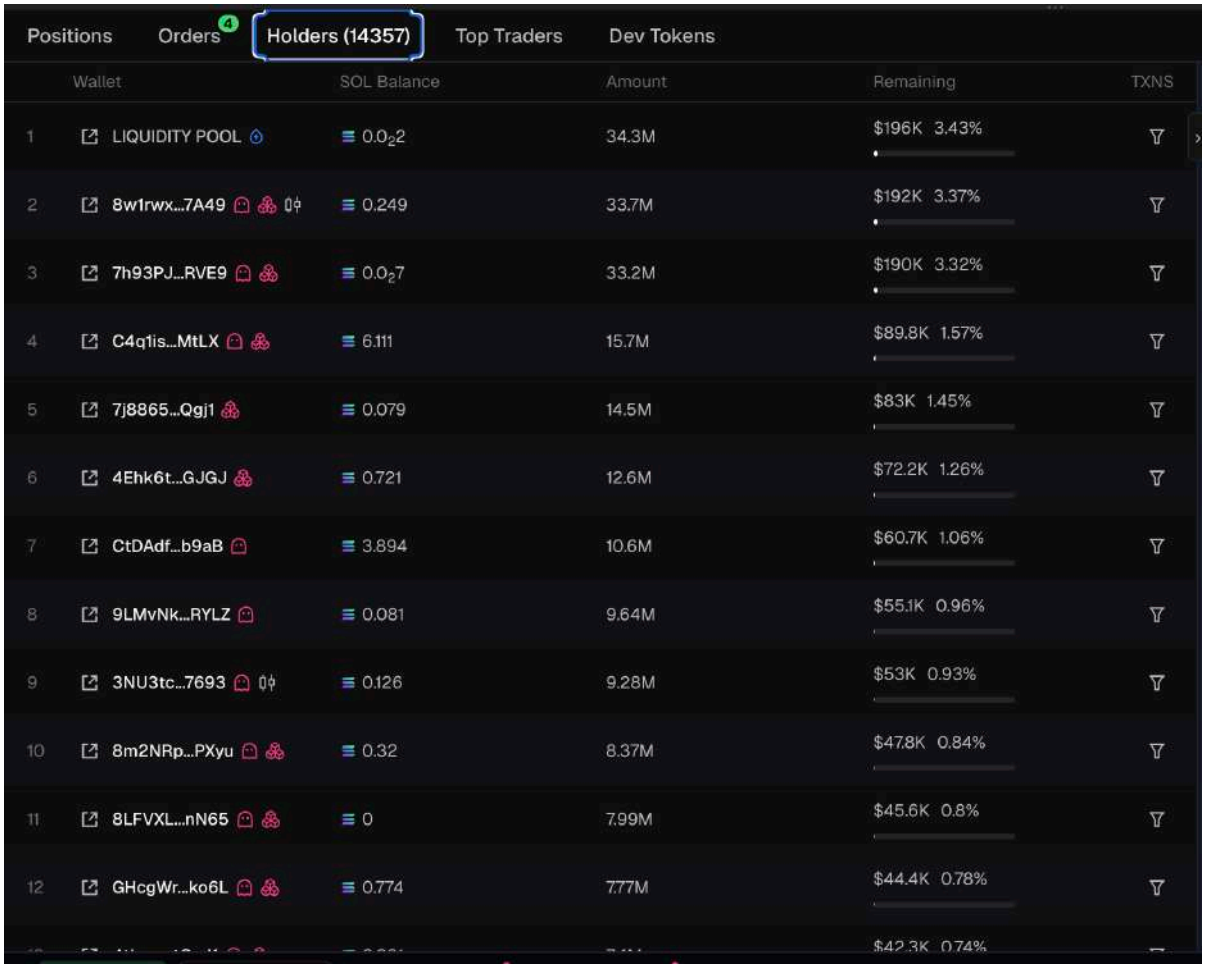
To determine which phase a coin is in, check these metrics:

1. **Price Action vs. Volume**:
    - Rising price + rising volume = Hype or early Pump phase
    - Rising price + declining volume = Late Pump phase (danger)
    - Declining price + high volume = Early Dump phase

You can track volume in Axiom Pro

> 5 min volume is one of the most important metric for me

1. **Holder Analysis**:
    - Monitor Diamond Hand percentage on Axiom
    - Track holder growth rate (new holders per day)
    - Watch for whale accumulation or distribution



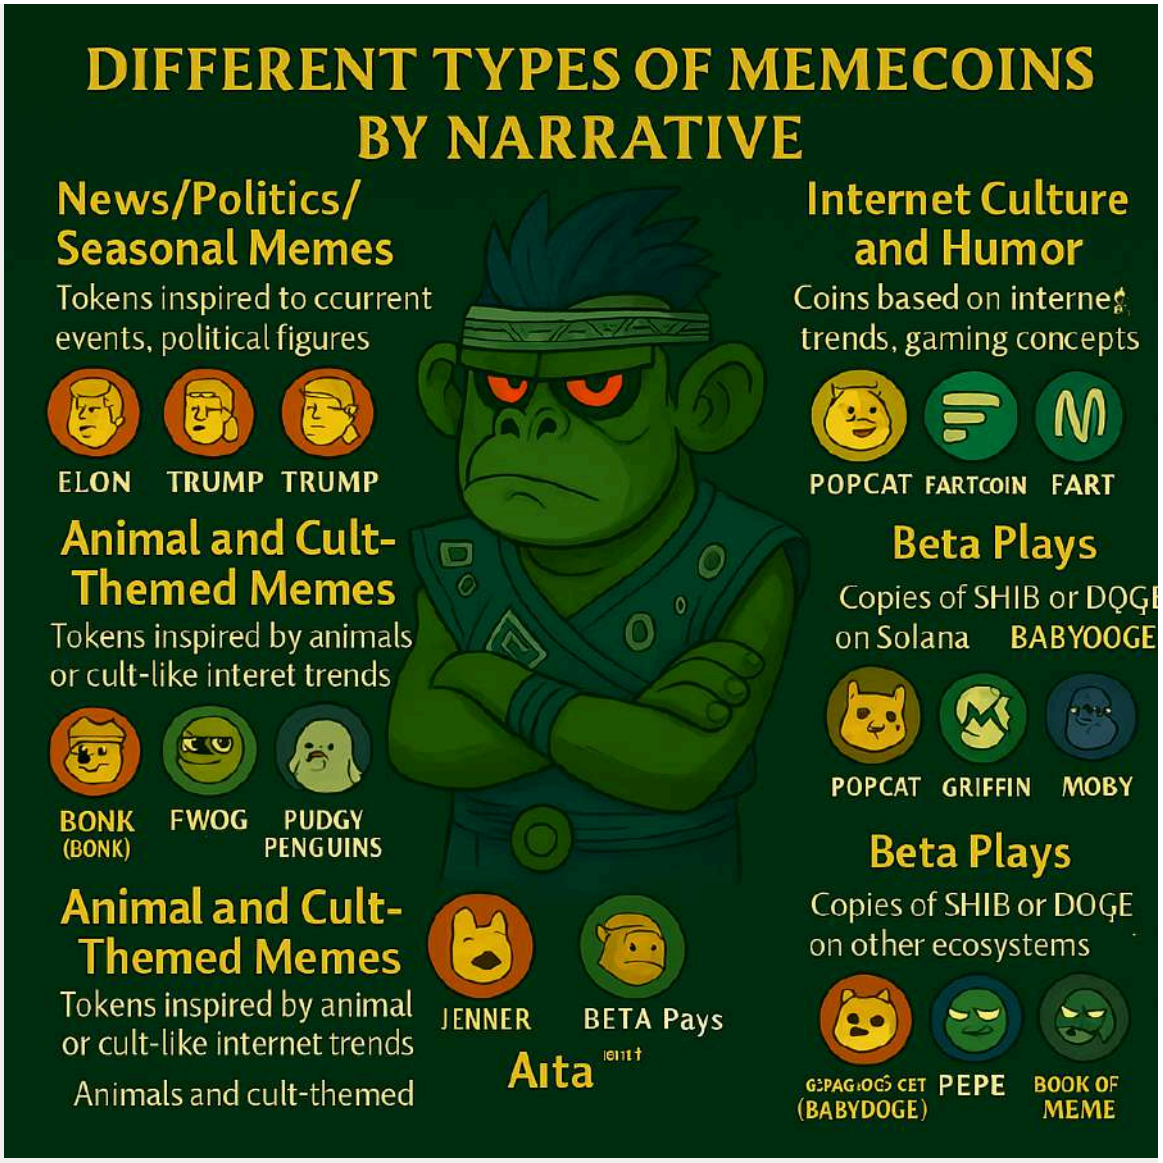
Positions | Orders 4 | Holders (14357) | Top Traders | Dev Tokens

	Wallet	SOL Balance	Amount	Remaining	TXNS
1	LIQUIDITY POOL	0.0$_2$2	34.3M	$196K 3.43%	
2	8w1rwx...7A49	0.249	33.7M	$192K 3.37%	
3	7h93PJ...RVE9	0.0$_2$7	33.2M	$190K 3.32%	
4	C4q1is...MtLX	6.111	15.7M	$89.8K 1.57%	
5	7j8865...Qgj1	0.079	14.5M	$83K 1.45%	
6	4Ehk6t...GJGJ	0.721	12.6M	$72.2K 1.26%	
7	CtDAdf...b9aB	3.894	10.6M	$60.7K 1.06%	
8	9LMvNk...RYLZ	0.081	9.64M	$55.1K 0.96%	
9	3NU3tc...7693	0.126	9.28M	$53K 0.93%	
10	8m2NRp...PXyu	0.32	8.37M	$47.8K 0.84%	
11	8LFVXL...nN65	0	7.99M	$45.6K 0.8%	
12	GHcgWr...ko6L	0.774	7.77M	$44.4K 0.78%	
				$42.3K 0.74%	

Remember: 80% of trading success comes from correctly identifying which phase a coin is in and trading accordingly. The same strategy doesn't work across all phases.

▼ 1.4 - The Different types of Memecoins

Different Types of Memecoins by Narrative



1. Cult & Animal Memes

Tokens inspired by animals or cult-like internet trends and personalities.

- **Retardio:** Playful humor with a cult-like following.
- **Gigachad (GIGA):** Meme about masculinity and self-improvement.
- **Sigma (SIGMA):** Based on the "sigma male" archetype.
- **Pudgy Penguins (PENGU):** NFT-linked penguin-themed meme coin.

2. News/Politics/Seasonal Memes

Coins tied to current events, political figures, or seasonal themes.

- **Elon Fart Coin:** Humor-based token referencing Elon Musk.
- **Trump Coin:** Political token inspired by Donald Trump.
- **FIFA Coin:** Sports-themed token tied to football events.
- **Seasonal Tokens (e.g., Christmas, Summer):** Coins launched around specific holidays or seasons.

3. Internet Culture and Humor

Coins based on internet trends, gaming culture, or humorous concepts.

- **MLG:** Referencing "Major League Gaming" culture.
- **Fartcoin (FARTCOIN):** Toilet humor-inspired token.
- **SPX6900:** Satirical take on financial indices like the S&P 500.
- **Vine (VINE):** Nostalgia-driven token inspired by the Vine app.

4. AI and Tech-Themed Memes

Tokens that integrate AI or are inspired by technology trends.

- **Zerebro:** Embodies collective intelligence concepts.
- **Griffin AI:** Combines AI with blockchain integration.
- **Moby:** AI-driven token with a focus on automation.
- **Goat (Goatseus Maximus):** Inspired by AI experiments and humor.

5. Personality/Pop Culture/TikTok Memes

Tokens tied to celebrities, influencers, or viral social media trends.

- **Routine:** Inspired by a viral TikTok fitness influencer's routine.
- **Ghibli:** Possibly referencing Studio Ghibli's iconic animations.
- **ChillGuy (CHILLGUY):** Represents a laid-back internet persona.

6. Beta Plays

Tokens that mimic successful coins from other chains or replicate recent viral hits.

- Examples:

- Copies of SHIB or DOGE on Solana.
- Replicas of PEPE or BONK from other ecosystems.

▼ 1.5 - Setting Realistic Expectation

Setting Realistic Expectations

Memecoin trading is more gambling than investing. Remember these principles:

- Most memecoins (90%+) eventually lose value and approach zero
- Successful traders focus on risk management, not just finding "moonashots"
- The key to profitability is capturing explosive upside while limiting downside
- Only trade with money you can afford to lose entirely

For perspective: a $100 investment in the right memecoin can yield $1,000-10,000, but you might need to make 10+ attempts before finding a significant winner.

Remember: The traders who survive and thrive approach memecoin trading with discipline, not desperation.

————————-

The Hard Numbers of Memecoin Trading

xLet's be clear about the reality:

Outcome Category	Percentage of Memecoins	What This Means For You
Complete Failures	70-80%	Most coins you buy will lose 90-100% of their value
Moderate Success	15-20%	Will pump 2-5x then slowly decline
Major Success	3-5%	Can pump 10-100x before significant correction
Home Runs	<1%	The rare 100x+ coins that make headlines

The Memecoin Math That Matters

Even with these brutal statistics, you can still be profitable if you understand the math:

```
10 trades × $100 each = $1,000 total investment

7 failures: -$700 (total loss)
2 moderate wins: $100 → $300 each = +$400
1 major win: $100 → $3,000 = +$2,900

Net result: $2,600 profit from $1,000 invested
```

This demonstrates why risk management matters more than picking winners. One significant win can cover multiple losses.

… but if you risk too much, you will not survive enough to hit your winner.

Practical Risk Management Framework

1. **Position Sizing**: Never risk more than 1-2% of your total portfolio on any single memecoin
2. **Diversification**: Spread capital across multiple opportunities rather than concentrating
3. **Profit Taking**: Secure initial investment as soon as possible
    - At 2x max, take out your initial investment
    - At 3x, take 25-50% of remaining position
    - Let remainder ride (moonbag) and take profit on the way
4. **Mental Preparation**: Expect most trades to fail and plan accordingly
    - Have exit strategies for both success and failure
    - Don't become emotionally attached to any coin

Trading with discipline means accepting losses as part of the process while structuring your approach to capitalize on the occasional big winner.

▼ 1.6 - Why it’s urgent?

Why it’s urgent? Crypto Cycle explain

Crypto as many other financials market work in cycle.

Bull Market = Uptrending market = Bullish 📈🟢 (1/1,5 Years)

Bear Market = Downtrending market = Bearish 📉🔴 (2/3 YEARS)

In general we have cycle of 4 years in total

Most of the best traders & investors make most of their money during the Bull Market & prepare their plans during the bear market.

We can deconstruct the cycle in different phases:

- Bear Market (Downtrend)
- Bear Market (Uptrend) or Pre-Bull
- Bull Market 1st Pump
- Bull Market 2nd Pump

We are actually between 1st & 2nd pump when i’m writing these lines in March 2025.

It mean that we are about to hit the most profitable phase of the cycle.

During this phase of euphoria that will last 3-9 months (maybe less maybe more), we are going to have easy money.

It’s the type of time when you can hit daily x50 on the morning before your coffee even had time to dripped.

SO you need to be LOCK IN if you want to make MASSIVE GAINS.

The good thing is you can play this game in three different way, either you go super active or super passive (or in middle)

▼ 1.7 - Define your type of trading

As I said the good thing is you can play this memecoin game in three different way:

- **Hardcore Trencher**

8-12+ Hours per day

It’s time . You’re ready to dedidacate your life for the trenches. Congratulations, this is where hero die & born.

This is where legendary traders has been forged.

When you engaged yourself in the trenches there is no turning back. Only sweat & tears are waiting for you but if you survive ….. the treasure beyond is above all your expectations.

Hardcore Trenchers are okay to put their life aside for a few months in order to make it.

They are ready to leave everything for success :

No shower. No Sleep. No Eat.

(I’m kidding, go at least wash yourself)

When you’re a Trencher you’re not here only for the treasure but because you like the process and 12 hours of time front of a computer don’t scare you.

Type of trading : Scalping / Day Trading

- **Opportunity Enjoyer**

Less than 1 Hour per day

You have a life and probably a job or something and even finding 1h per day is hard for you.

That’s okay, we don’t have all the same time.

Good news is you can enjoy this market without having to spend too much time …

If you simply learn basics in this guide & follow calls, with the good strategy you will be able to scale your portfolio without even putting a few minutes per day.

The approach is strategic, methodic and target maximum profit at each investment

Position Trading / Swing trading / Scalping

- Hybrid Warrior

2 to 6 hours per day

You’re dedicated to spend a few hours per days into Trenching to maximize profit and opportunities while still enjoying your life.

You probably imagine yourseelf waking up in a beach getting a massage and drinking fresh coconut milk after closing 6 figures profits in the morning.

The perfect balance between opportunities and flexibility.

This is the path I chose.

Sometimes the hybrid warrior know how to stay away from the jungle and not

As an Hybrid warrior you're active enough to catch opportunities & passive enough to don't get eaten alive by the jungle.

Type of trading : Scalping / Day Trading / Swing trading / Position Trading

Action Items

📍 **Complete these before continuing**
📍 **These build your foundation for successful trading**
📍 **Each task takes less than 15 minutes**

- [ ] Open Pump.fun & click on 3 new coins
- [ ] Open https://www.coingecko.com/en/categories/meme-token?asset_platform_id=solana and check the top memecoins on Solana
- [ ] Join 2 active memecoin Telegram communities to observe engagement patterns

▼ Summary module 1 📜

> ***Memecoins are attention-driven assets where community engagement and virality create value, not utility or technology.***
>
> ***Understanding this psychological foundation is crucial - the more eyes on a coin, the higher it goes.***
>
> ***This isn't technical analysis or fundamental investing - it's about spotting trends, moving quickly, and understanding what makes content go viral.***

> ***Trading with this mindset immediately puts you ahead of 95% of traders still looking at the wrong metrics.***

💡 **3 Key Takeaways** 💡

- Community size and engagement matter more than any technical aspect of a memecoin
- The ability to explain a memecoin's concept in one sentence predicts its viral potential
- Timing your entry in the early hype phase (not launch, not pump) yields the highest returns

💡 **3 Common Mistakes to Avoid** ⚠️

- Analyzing memecoins using traditional crypto metrics like utility or partnerships
- Waiting for "confirmation" from major influencers (by then it's too late)
- Holding too long because you believe in the "long-term potential" of a meme

▼ MODULE 2 : Essential Setup 🛠️

Quick Win Technique:

Create a "Trading Command Center" bookmark folder right now with these five essential shortcuts:

- DEX Screener (with Solana filter preset) dexscreener.com/solana
- Twitter https://x.com/
- …. (we will add more later in this module)

This simple 2-minute setup will save you crucial seconds when opportunities arise—and in memecoin trading, seconds literally equal profits.

MODULE 2 : Essential Setup 🛠️

▼ 2.1 Critical Tools

▼ (Important) These tools give you an edge over 95% of traders:

AXIOM PRO

The tool that I use are multiple but you don’t need to have too much to start doing good trades.

For the purpose of this tuto, I recommend you to use Axiom Pro which has some features that are very usesfull when you start trading.

I use also Neo Bullx but there is a huge waiting list while Axiom is also doing a great job.

You can use my link to start trading on Axiom:

Axiom

The Gateway to DeFi

https://axiom.trade/@rexblack

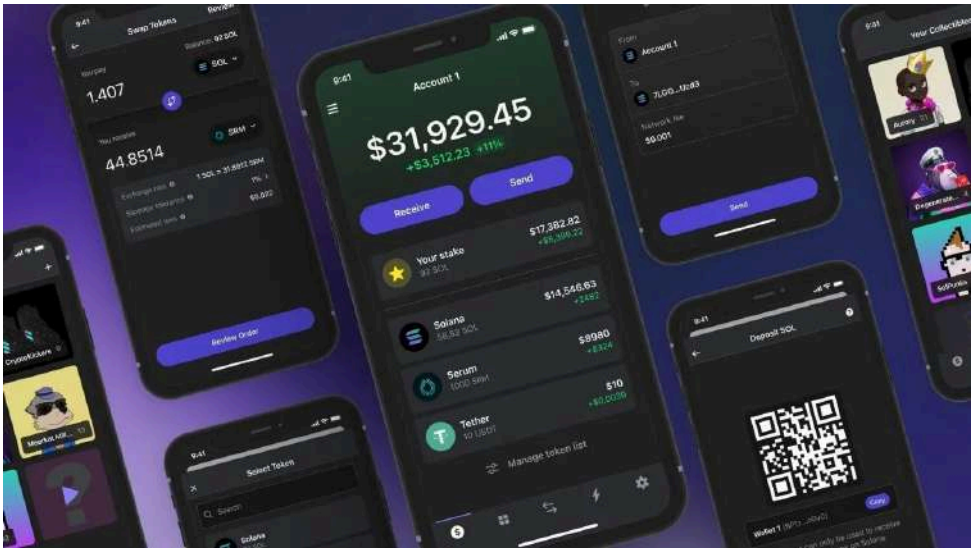
Axiom will be your base for everything. You will find coin & execute trade most only on this platform.

I recomend you guys to always trade on computer and not on phone (except if you use Vector)

Check the full Axiom beginner tutorial in the next chapter

Phantom Wallet

- Phantom Wallet is a chrome extension (or mobile app) that you can use to manage your SOL



Phantom: The crypto wallet for everyone

Phantom is your go-to crypto wallet. Buy cryptocurrency. Trade memecoins. Store your assets. Grow your portfolio. Available on Solana, Ethereum, Bitcoin, Base, and Sui.

https://phantom.com/

> Phantom will give you the private key of your wallet. NEVER EVER give this private key to anyone.
>
> With your private key, anyone can access to your wallet and steal your funds.
>
> I recommend after some time buying a physical hardware wallet like a Ledger that you will use to store your capital so you don’t expose yourself to too much risk by having all your funds on your trading wallet

Phocaine Chrome extension (not so mandatory but must have:

Phocaine - Chrome Web Store

Extends Photon and BullX with some useful features

https://chromewebstore.google.com/detail/phocaine/knpaejbpcjcfmiaoljglehnabcepjgmb?hl=en

With Phocaine you can have some information display like : dex paid, … etc

Also you need to create an account on :

- Twitter
- Telegram

▼ (Optional) These tools give you an edge over 95% of traders:

GM/GN = can help you indentify good traders and track their wallet

https://gmgn.ai/sol?chain=sol

Click on Copy trade → Smart Money

Then identify a potential good trader :

Click on his profile to have more details and copy & keep the wallet adress so you can track it later on axiom

▼ Telegram Bots:

- Recommended: DexTools Alert Bot, Whale Alert, New Pair Scanner

- Configuration: Set dollar thresholds that match your trading capital
- Integration: Connect to mobile notifications for 24/7 alerts

@TrenchScannerBot - To scan bundle (no need if you use Axiom)

@SolDeck - To have dex paid alert & more

▼ Vector (Mobile):

- What it does: Sends instant alerts when whale wallets make moves
- Key setting: Configure for transactions >$1,000 to filter noise
- Pro tip: Create separate alert channels for different sizes of transactions

If you want to trade on mobile you NEED vector. it's the best social memecoin trading app

You need an invite for vector, here is mine:

Vector Refcode: Chris__Blvck

Follow my trades Chris__Blvck on Vector - the largest social crypto trading app.

https://vec.fun/ref/Chris__Blvck

▼ KOL Scan:

- Purpose: Monitors key opinion leaders to spot emerging trends
- Setup: Track 10-15 accounts known for calling early winners
- Time-saving tip: Configure to only alert for projects mentioned by multiple KOLs

https://kolscan.io/leaderboard

RUG checker:

https://rugcheck.xyz/

▼ LunarCrush:

- Key metrics: Galaxy Score, Social Volume, Social Dominance
- Significance: Identifies coins gaining social momentum before price moves
- Usage: Check daily for coins with rapidly improving metrics

https://lunarcrush.com/discover/solana

SOL incinerator :

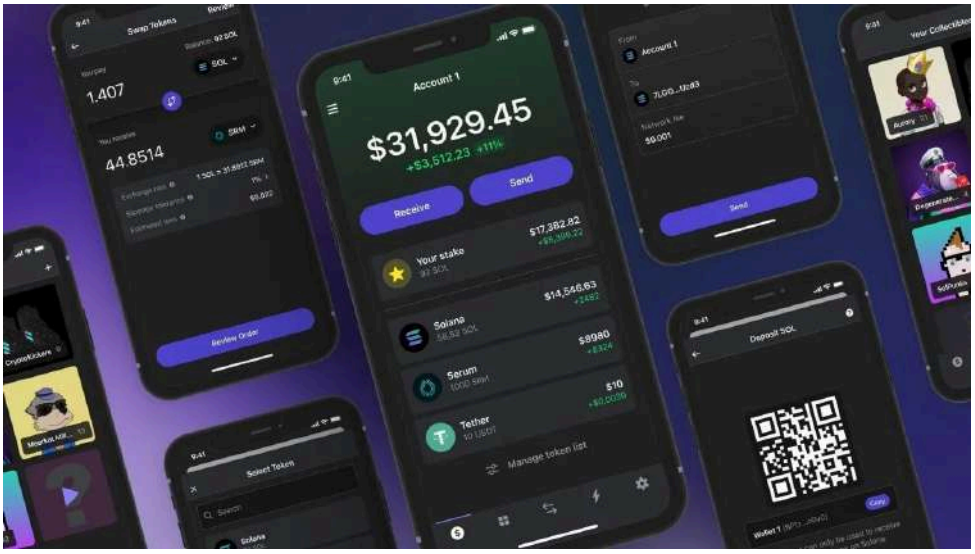
https://sol-incinerator.com/

Clean up your wallet & get some SOL back

▼ 2.2 Deposit Funds on your Phantom

now we need to have some SOL on the account

HOW TO CREATE A PHANTOM WALLET & DEPOSIT SOL ON PHANTOM:



- Create a new wallet
- Save the seedphrase in a safe place

To depositi you can send from a CEX or you can click on Buy :

Choose SOL:

Choose the ammount:

Click on buy and follow the process to pay with your card with MoonPay for example

Once done you can now send fund to AXIOM

METHOD 2 = Sending from an exchange

You can also send directly funds from an exchange like Binance/Coinbase/Kucoin … etc

Be careful and be sure to choose SOL network when you send the funds

▼ 2.3 Axiom Pro Beginner Tutorial

DEPOSIT FUNDS ON AXIOM

Now that you have funds on your phantom wallet, let’s deposit some on AXIOM

On the top right Screen click on Deposit (default color is blue)

Then a pop up will open :

Copy the adress and go back to your phantom wallet to send the fund to your axiom wallet

Once done you're all set to trade ! Now let's do an overview of Axiom with some features you will use during your trading.

AXIOM OVERVIEW

In the top left you have different sections.

The only ones you're going to use:

- PULSE
- TRACKERS
- PORTFOLIO
- REWARDS

PULSE

Here you can find about all the new pump fun token.

GOOD THING → You can filters coins in order to see only good potential coins and avoid rugs like this.

We are going back to these parameters later in Module 4.

In pulse you're going to spend most of your time.

Trackers

Here you can add

- Wallet tracking

→ Crypto is the only market where you can see what other buy and sell exactly. As all behavior are on chain it’s easy to get an edge by following whales (big buyers) & smart money (high profitable traders).

- Twitter Alerts

→ With twitter alerts you can get a notification when ELON tweet for example, giving you an edge to everyone as you can then snipe coins coming around the narrative

---

Once you’re in a coin you can have different informations (we’re going back to it later):

- Volume on top right :

On the right you can find everything you need for trade exectution and token info

Order book where you see who buy & sell

Holders counts & top traders to track on chain activity

With the bubblemap you can indentify “clusters” = Group of people connected or same individuals with different wallet - It’s dangerous because they can dump on you

BUY/SELL

You can find different parameters like buying/selling at marketprice or buying/selling with a target price

▼ 2.4 Optimizing AXIOM Technical Settings

Small adjustments make huge differences in your execution:

By default, the preset of AXIOM included some fees like Priority fees & Bribe

These fees are important if the coin have a lot of volume so you can be faster than anyone by paying these fees.

I recommend at the beginning to put all these fees to 0 as it can escalate fast, especially at the beginning.

Platform like Axiom take also 1% on Buy/Sell in addition of the execution fees (priority/bribe)

You can parameter different preset for that. For example a 0 fees preset & one that you will use only when there is high volume

Slippage Settings:

- **For buying**:
  - Standard tokens: 10-15% slippage
  - New/volatile tokens: 20-30% slippage
  - Emergency buys during fast pumps: Up to 50% (use with caution)

- **For selling**:
  - Always set 10-15% higher than buy slippage
  - During market crashes: 40-50% may be necessary
  - Remember: Getting out with some profit beats perfect execution

- **Priority Fees/Bribes**:
  - Normal market: 0.0001-0.0005 SOL
  - Hot tokens/competitive entry: 0.001-0.005 SOL
  - Critical exits during crashes: Up to 0.01 SOL

What's MEV Protection ?

MEV stands for **Maximal Extractable Value**.

A **MEV bot** is like a sneaky robot that watches the blockchain **before** your trade is confirmed. It looks for juicy opportunities to **buy or sell just before you** (front-run) or **right after you** (back-run) to **profit from your move**.

💥 How It Affects You as a Trader:

Imagine this:

- You're about to **buy a meme coin early** on a new launch.
- A MEV bot **spots your transaction** in the queue (called the mempool).
- It quickly **places its own buy before you**, pumping the price.
- Then your trade goes through — but now you're **buying at a worse price** 💸.

Same for exits:

- You want to **sell during a pump**.
- The MEV bot **sells right before you**, crashing the price.
- Now you sell for **less than expected**.

🚫 Why It Sucks:

- You lose **ideal entries and exits**
- You get **slippage**
- You basically get **outplayed by bots**

✅ How to Defend Yourself:

- Use **MEV protection features** (like in AXIOM)
- Add a little **priority fee** so your transaction confirms faster
- Avoid trading **large amounts during high volatility** without protection

⚠ Use Mev bot only if you trade with big amount and on established coin.

▼ 2.5 Organizing Your Trading Workspace (soon)

Efficiency equals profit in fast-moving markets:

- **Browser Setup**:
  - Trading window: Keep AXIOM or preferred platform always open
  - Research window: DEX Screener, social monitoring tools
  - Wallet window: Phantom and transaction history

- **Bookmarks Organization**:
  - Create folders by function: Trading, Research, Wallets, Charts
  - Pin most-used tools to bookmark bar for one-click access
  - Consider a dedicated browser profile just for trading

- **Physical Setup Recommendations**:
  - Minimum: Laptop + external monitor
  - Optimal: Two monitors (trading + research)
  - Advanced: Three monitors (trading, research, social/alerts)

I don’t recommand to trade on phone so be sure to have a descent set up

---

- **Record Keeping**:
  - Keep trading journal open in note-taking app
  - Log entry/exit points and reasoning
  - Record emotional state to identify pattern weaknesses

Keep track of all your trade

Workspace Efficiency Checklist:

- All tools accessible within 1-2 clicks ✓
- Critical alerts configured for mobile and desktop ✓
- Organized bookmark structure ✓
- Trading journal template ready ✓

Remember: In memecoin trading, seconds matter. Your workspace should be optimized for speed and focus, eliminating distractions and unnecessary steps.

Action Items

📍 Complete these before continuing to Module 3

📍 These tools will give you an immediate edge in finding opportunities

📍 Each task builds your trading infrastructure

☐ **Set up your first smart wallet tracker**: Configure Axiom to track at least 5 high-performing wallets (>70% win rate)

☐ **Create an optimized browser workspace**: Set up a trading profile with organized bookmarks for all essential tools

☐ **Configure your first real-time alert**: Set up volume and price notifications for 3 tokens you're watching

☐ **Test your technical settings**: Perform a small test trade ($1-2) to verify your settings

▼ Summary Module 2 📜

> The right tools and setup are your unfair advantage in memecoin trading.
>
> While others rely on luck or chase after pumps, your optimized system lets you spot opportunities early, execute trades efficiently, and monitor the market with precision.
>
> This isn't just about having tools—it's about configuring them correctly and creating a workspace that eliminates decision lag.

> The minutes you save through proper setup translate directly into better entry prices and higher profits.

3 Key Takeaways 💡

- Following successful traders through wallet tracking provides better signals than any technical indicator
- Proper slippage settings (higher for selling than buying) are crucial for executing trades during volatile periods
- A systematically organized workspace reduces decision time, directly improving your profitability in fast-moving markets

3 Common Mistakes to Avoid ⚠️

- Setting up too many alerts without proper filtering, creating information overload and missed opportunities
- Using default slippage settings across all transactions, resulting in failed trades during critical moments
- Trading without MEV protection on significant positions, allowing validators to front-run your transactions and increase costs

Next Challenge:

In Module 3, you'll learn how to analyze memecoin fundamentals using these tools to identify high-potential opportunities before they pump.

Your configured workshop will become your command center for implementing these analysis techniques.

▼ MODULE 3 : Opportunity Discovery 🔎

Quick Win Technique:

Set up this specific filter on AXIOM Pro, enable “AT LEAST ONE SOCIAL” for each collumn.

This filter itself out obvious scams while focusing on tokens with genuine traction before major pumps.

MODULE 3 : Opportunity Discovery 🔎

▼ 3.1 Effective Scanning Methods

Finding opportunities before others is the key to memecoin profits:

- **Filtering Strategy**:
  - Market Cap Filter: Focus on 10K-5M market cap range (small enough to 10x, large enough to be liquid)

    - Token Age: For trending coins, prioritize tokens Less than 14 days old (sweet spot for momentum)
    - Liquidity Depth: Minimum $5K liquidity to ensure you can exit positions
    - 24h Volume/Market Cap Ratio: >50% indicates healthy trading activity
    - "At least one social" filter to verify basic legitimacy and avoid obvious scams
- **Speed Techniques**:
    - Use middle-mouse click to open tokens in new tabs for rapid evaluation
    - Set up saved filter presets on Axiom

Finding new low cap Gems

Let’s take a look at what you need to know to find a good coin.

For that in Axiom we are going to use different types of filters to minimize seeing rugs.

If you see less rugs, you’re going to automatically avoid most of them

NEW pairs Filters:

- ☒ Social at least 1
- Holder at least 20
- Token Age : 45min max

Final Stretch Filters:

- ☒ Social at least 1
- Top holders : Max 35%
- Insiders supply : 25% max

- Bundles supply : 25% max
- Holders : 25min
- Liquidity : 7k mini
- Volume : 20K mini
- Marketcap : 15k mini
- Txns: 25 mini
- Token Age : 45min max
- Pro traders : 10 min

Migrated Filters:

- ☒ Social at least 1
- Top holders : Max 30%
- Holder : 100 min
- Insiders supply : 25% max
- Bundles supply : 10% max
- Marketcap : 15k mini
- Txns: 25 mini
- Pro traders : 50 min

▼ 3.2 - Smart Money Tracking

"**Trading blindfolded?** Smart traders aren't psychic—they track smarter money. Here's exactly how."

🔎 Why Track Smart Wallets?

Successful memecoin trading isn’t about luck—it's about positioning.

Whales and consistent winners leave clues through their trades.

Think of whales like elephants stampeding through the market; smaller traders follow blindly, creating powerful momentum.

Recognize it early, profit wisely.

🎯 Finding Smart Wallets (Action Steps):

1. **Using AXIOM Wallet Tracker:**
   - Navigate to **Wallet Tracker → Import Wallet**.
   - Focus on wallets with a **>70% win rate**.
   - Prioritize consistent performers over one-hit wonders.
   - Pay special attention to early investors in previously successful projects—they often repeat their success.

Example: The "Trump Memecoin Whale" executed 2,345 trades with an average 97% ROI—wallets like these should always be on your radar.

1. **GM GN Method:**
   - Visit **GM GN → Copytrade Tab → Smart Money**.
   - Click on wallets with high performance metrics.
   - Add promising wallets to your personal tracker.

1. **AXIOM Holder Analysis:**
   - Click **Holders / Top Traders**.

- Explore and select wallets based on historical returns.

- Add chosen wallets directly to your tracker.

(You will find at the end of this module a long list of 100+ wallets to track from KOL/whales/smart - feel free to use them and/or add some based on yours research)

Once the wallet tracked will buy or sell it will appears on the chart

---

🔔 Wallet Alert Setup (Step-by-step):

Set alerts to immediately capture whale moves:

1. **Telegram Alert via Toxi Bot:**

Toxi Solana Bot

Fastest Snipe Bot humanity has ever seen Ranked №1 by SOLANA community Twitter: https://x.com/ToxiSolanaBot

https://t.me/toxi_solana_bot?start=r-IwKe9x

- Set up Toxi Solana Bot and click **Start**.

- Select **Copy Trading** → **Add Wallet** (don't enable automatic copy trading).

- Configure alerts under **Degen Settings**:

  - Recommended settings:

    - Min Market Cap: **15K**

    - Max Market Cap: **50M**

  - No need to adjust other parameters if you're just tracking.

- Ensure alerts are activated. Now you'll get immediate notifications directly on Telegram whenever whales make significant buys or sells.

2. **Alternative Alert Tools:**
   - **Vector, Asset Dash WhaleAlert, or AXIOM**: These platforms provide real-time notifications tailored to your criteria. Experiment to find your best setup.

Action Items

📍 Complete these before advancing to Module 5

📍 These activities will sharpen your opportunity discovery skills

📍 Each task builds your toolkit for finding early opportunities

☐ **Create your personalized filter preset on DEX Screener**: Configure with recommended parameters (10K-5M market cap, 1-14 days old, min $5K liquidity, "has profile" enabled)

☐ **Track 5 top-performing wallets for one week**: Use Axiom or Bullx to follow successful traders and document their trading patterns

☐ **Identify and analyze 3 emerging narratives**: Monitor social platforms to find trending themes and evaluate their potential using engagement metrics

☐ **Practice quick-scan evaluation**: Time yourself analyzing 10 new tokens in under 30 minutes using the middle-mouse click technique

☐ **Set up real-time alerts**: Configure notifications for smart money movements on at least one tracking platform (Whale Alert, Vector, or DexCheck)

▼ Summary Module 3 📜

> Finding opportunities early is what separates profitable traders from those who consistently buy tops.
>
> This module equipped you with systematic methods to discover promising memecoins before they trend, track smart money movements that signal potential winners, and identify

> powerful narratives that drive price action.
>
> By combining technical filtering, wallet tracking, and narrative analysis, you now have a comprehensive approach to discovering high-probability trades before most traders even know they exist.

3 Key Takeaways 💡

- The sweet spot for memecoin opportunities is tokens 1-14 days old with market caps between $10K-$5M and healthy liquidity ratios
- Following successful traders (70%+ win rate) provides stronger signals than any technical indicator, especially when multiple smart wallets converge on the same token
- Narratives drive memecoin valuations more than fundamentals—coins with simple, instantly recognizable concepts that spread cross-platform have the highest potential

3 Common Mistakes to Avoid ⚠️

- Relying solely on one discovery method instead of combining filtering, smart money tracking, and narrative analysis
- Following too many wallets and getting overwhelmed with notifications instead of focusing on a select few high-performers
- Discovering good opportunities but hesitating too long to execute, missing the optimal entry window during the early hype phase

Next Challenge:

In Module 5, you'll learn proven entry and exit strategies to maximize profits once you've discovered promising opportunities. The scanning and tracking skills from this module will help you find the best candidates for applying those tactical trading technique

▼ MODULE 4 : Coin Analysis Masterclass 🧐

Quick Win Technique:

Before buying any memecoin, perform this 30-second scam check:

- Insiders numbers
- Snipers Numbers
- Top 10 Holders
- Volume/Buy (artificial or organic)
- How many holders ? How many pro trader (Axiom or bullx users)

MODULE 4 : Coin Analysis Masterclass

▼ 4.1 Introduction to Fundamentals analyse

Analysing a coin is an Art.

Fortunately, I will save you some time by telling you what’s the important metrics to look at.

Remember, memecoins are based on the attention economy. almost everything about this market is based on psychology.

You can have the best TA, it won’t help you to perform with memes if you don’t understand why people are going to buy your coin in a higher price.

Besides the chart, there is 4 important things to check when you analyse a coin

We call this fundamental analys. It’s even more important than technical analyse because in memecoins most of the coins are rugs so the coin needs to have solid fundation

- Narrative

Is the story compelling enough to convince others to buy higher?

- Liquidity

Rising volume = rising confidence.

- Smart Money

Follow the GOOD whales—they rarely gamble blindly.

- Social Momentum

Memes thrive on attention; check Twitter & Telegram.

- + RUG CHECK

Every memecoin is guilty until proven innocent.

💡 **"Charts tell you what happened. Fundamentals tell you what's coming next."**

▼ 4.2 Narrative Analysis

Narratives shape memecoins more than any chart ever could. Master the narrative, and you master the market.

Reffer you to module 1 for the introduction to narratives:

Narratives trigger the strongest emotional reactions—greed, fear, FOMO—and are the invisible force behind explosive memecoin moves.

Learn to decode these narratives early, and you'll stay ahead of the herd.

🎯 How to Identify Powerful Narratives:

- **Instant Appeal:**
  - Your grandma should understand the meme instantly.

    - Visual simplicity and clarity are key. Memes must be instantly recognizable and memorable.
- **Cultural Relevance:**
    - Tap into trends already buzzing in mainstream culture (elections, major events, viral challenges).
    - Example: **PolitiFi tokens** often skyrocket around political elections due to heightened emotions and media coverage.
- **Simplicity Over Complexity:**
    - Avoid overly intellectual or complicated memes; simple, humorous, easily shareable memes drive adoption.

📈 Measuring Meme Momentum:

- **Engagement-to-Follower Ratio:**
    - High-quality engagement (comments, shares, likes) matters more than follower count.
- **Cross-Platform Virality:**
    - Narratives that spread across multiple platforms (Twitter → Telegram → TikTok → Discord → TV) indicate significant potential.
    - Remember: the more conversations, the higher the potential pump.
- **Mainstream Potential:**
    - Memes breaking beyond crypto audiences (TikTok, Instagram, mainstream media) often go parabolic.

⚡ Quick Checklist: Is This Meme Gold?

- ✅ Instantly recognizable?
- ✅ Already trending in mainstream?
- ✅ Easy to share in 2 clicks?
- ✅ Engaging wider audiences beyond crypto?

🎯 **Remember:**

Combine narrative strength with smart money validation and healthy metrics for a high-probability moonshot.

Example of good narratives:

▼ $Routine

$Routine : This influencer posted a 5 hours morning routine that went ultra viral.

the trend was above web3 and many people started to reproduce their own version of morning routine.

Strength: Highly relatable, humorous, and visually shareable—perfect memecoin ingredients.

▼ $Ghibli

$Ghibli

Another good narrative this year was Ghiblification. With the new Chat GPT update, the trend went viral, many famous people started posted their own ghiblification and all the twitter sphere were all ghibli

Strength: Capitalized on trending AI tech news and iconic cultural references—high mainstream crossover potential.

More analys up to come

▼ 4.3 - Social Momentum

🐦 Twitter/X Deep Dive:

Twitter will teach you a lot of thing.

You can copy and paste the ticker or click on this icon on Axiom:

This will bring you on twitter search so you will be able to check everything :

Frequency & Engagement:

- Active posting is a bullish sign—silence equals death in memecoins.
- Evaluate likes, retweets, and comments. Genuine engagement beats bot spam every time.

Follower Growth:

- Organic, steady follower growth indicates real community.
- Be wary of sudden spikes—often fake followers bought to hype the coin.

Engagement Ratio:

- High engagement (likes/comments per follower) shows strong, active support.
- Low engagement signals fake followers or dead hype.

Search the Hype:

- Always run a quick search for the coin's ticker/name.
- Check both "Top" (influencer hype) and "Latest" (real-time community sentiment).

Remember: Memecoins live or die by Twitter. Ignoring social analysis is trading blindfolded.

Check the ticker/name on twitter , then top & latest category to see what people are saying about it

🚀 Community Validation

Behind every moonshot is a thriving community. Weak community = weak pump potential.

Not all the memecoins will have a telegram but if they have you need to check if the activity is real or not.

Don’t listen to people saying that the coin will do x10 , they are probably bot or the first ones to sell

Click on some profile to see if they are real people, watch any red flags signs and always trust your guts

📢 Telegram Group Check:

Member Metrics:

- Growth matters—fast, organic growth signals hype building.
- Sudden member spikes? Probably bots. Verify closely.

Conversation Quality:

- Look for genuine, insightful discussions vs. endless "wen moon?" spam.
- Admin responsiveness matters—ghost admins signal red flags.

Transparency & Engagement:

- Active and transparent admins mean fewer surprises.
- Admins who avoid tough questions usually have something to hide.

🤖 Bot Detection Checklist:

- ✅ Natural conversation flow? Bots post repetitive, unnatural messages.
- ✅ Timing of messages—bots spam at unnatural intervals.
- ✅ Cross-reference Telegram activity with actual trading volume—real buzz aligns with real trades.

Pro tip: Always trust your gut. If the community feels fake, the pump probably is too

🚩🚩🚩🚩🚩🚩🚩🚩🚩🚩🚩

▼ 4.4 - Smart Money / Whales

Smart money moves markets silently. Spotting their patterns early can put you ahead of most traders.

The best play are to find a “runner” , a coin that will outperform all the others coins of the day.

Often you can find them buy seeing a lot of different whales start buying large ammount before the price pump

In general, these can be insiders moves that you can easily follow but always be careful as whales can be wrong sometimes.

if you see a whale buy cluster with an increase volume on a banger coin - think about it. Maybe it’s worth a buy

🔎 How to Identify Whale Movements:

- **Track Accumulation:**
  - Regularly monitor major wallet activities using **Axiom Wallet Tracker**.
  - Consistent whale buys in a sideways market often signal upcoming pumps.
- **Coordinated Patterns:**
  - Watch for multiple large wallets buying simultaneously or in quick succession.
  - Clustered entries strongly suggest insider knowledge or confident market sentiment.

- **Timing Matters:**
  - Early whale entry (right after coin launch or during quiet accumulation phases) offers the strongest signals.
  - Late-stage whale activity (sell) may indicate distribution phases, which could be bearish.

🚩 Advanced Whale Watching Tips:

Use whales tracking as a confluence. Don’t copy trade but follow their movement , track their previous trade history with axiom, rate their PnL, create a google excel if you want to do avanced tracking

Crypto is the only industry where you can see who’s buying/selling & what they hold. So better to take advantages of the on chain data & do an advanced analyse of them

—-

- **Check Wallet Histories:**
  - Look into the past trades of top wallets—successful track records reinforce bullish signals.
  - Avoid following whales known for pump-and-dump patterns.
- **Cross-Reference Volume Spikes:**
  - Increasing volume + whale activity = potentially explosive setups.
  - Sudden whale activity without volume or social buzz could indicate a short-lived manipulation.
- **Use as Confirmation, Not Trading Signal:**
  - Whale tracking should confirm your existing analysis, not replace it.
  - Always combine whale signals with fundamentals, narratives, and technical analysis.

- **Whale Movements**:
  - Track recent accumulation by successful traders
  - Monitor for coordinated buying/selling patterns
  - Use Axiom wallet tracker to follow smart money
  - Pay attention to: Timing of whale entries (early in pump cycle = stronger signal)
  - Multiple smart wallets buying = strongest confirmation
  - Smart wallets selling gradually = distribution phase beginning
  - Smart wallets holding through dips = conviction in longer upside

  - Top Holders

  Always check the top Holders, if they literally have hundred of thousand of $ in unrealised profit or if they still hold the dip it mean they really think the coin can goes higher.

  ### ⚡ Quick Whale Check Checklist:

  - ✅ Multiple whales entering around the same time?
  - ✅ Wallet history positive?
  - ✅ Increasing volume alongside whale entries?
  - ✅ Entry timing aligns with market structure?

  🎯 **Remember:**

  Whale activity is a powerful clue, but it's just one piece of your trading puzzle. Never copy blindly—always build your own conviction.

▼ 4.5 - Liquidity / Volume

📊 Liquidity & Volume Mastery

> "Price lies, but volume never does. If you ignore volume, you're trading blind."

Volume reveals the hidden forces behind price movements, making it your most reliable indicator of true market intent.

Always check the 5 min volume when you enter a trade, if it’s increasing it’s a good sign. If you see also the number of holders growing it’s a very very good sign that the coin is about to pump.

Be careful of price manipulation, many coins have fake volume. To indentify that you can check in the order book

(if you see multiple buy with the same amount from different people it’s probably volume bots)

🔥 Understanding Volume Trends:

- **Healthy Volume:**
  - Volume steadily rising along with price.
  - Indicates genuine market interest and healthy growth potential.
- **Suspicious Volume:**
  - Sudden volume spikes without any matching increase in community or social hype.
  - Often signals manipulation or bot-driven pump-and-dump schemes.
- **Warning Signals (Distribution Phase):**
  - High volume but price remains flat or slightly declining.
  - Suggests insiders or whales quietly exiting positions, transferring bags to less-informed traders.

  At some point the coin will correct. A bullish coin will retrace only 30-50% on his way up but at some point the reversal pattern will happen and the uptrend will change

  Recognizing a weak uptrend is a way to identify when the coin is about to drop and help you time up your exit !

💡 Key Volume Indicators:

- **Volume-to-Market Cap Flip:**
  - Significant bullish indicator when daily trading volume surpasses or matches the total market cap.
  - Indicates extremely high liquidity and strong momentum, ideal conditions for large moves.

volume should be higher than MC

When you enter in a coin the volume should ALWAYS be Higher than the Marketcap .

⚠️ Red Flags in Volume Analysis:

- Sudden large buys without subsequent follow-through volume (possible manipulation).
- Volume spikes that immediately vanish—indicative of wash trading.
- Discordance between social engagement (Twitter, Telegram) and sudden volume increases.

⚡ Quick Volume Check Checklist:

- ✅ Volume steadily rising alongside price?
- ✅ Organic social and community engagement matches volume?
- ✅ No unexplained sudden spikes without social proof?
- ✅ Volume-to-market cap flip confirmed for strong liquidity?

🎯 **Remember:**

Genuine volume is the heartbeat of a sustainable pump. Without it, any price move is built on thin ice.

▼ 4.6 - Red Flag & Rug Detection

In memecoin trading, spotting red flags early is the difference between moonshots 🚀 and painful rugs 💀 .

Rugs are multiple, sometimes a rug can become a big coin as the dev will sell then people will CTO the project.

A dev that sell is a good sign(except if it’s an AI project as you need the dev to stay in the coin)

If the dev is transparent about selling to pay the team for example it’s fine but most of the dev who rug will sell within the first hour anyway.

There is multiple type of rug & scams. Not only the dev can scammed you but also influencers that will tell you to buy because the coin will do a 100X before selling on your face right after.

The jungle is WILD. that’s why you need to become smarter than the jungle.

Here’s your blueprint to avoid getting rugged:

👤 Developer Activity Check

The devs behind the coin can either be your allies or your worst enemy:

- **Team Transparency:**

  An anonymous team isn't automatically bad—but an unwillingness to communicate openly is a huge 🚩.

- **Communication Patterns:**

  Regular, transparent updates build trust. Silence, vague replies, or dodging direct questions means they're hiding something.

- **Previous Projects:**

  Always use tools like **Axiom Pro** to see the dev's history. Past rugs are the clearest sign of future danger.

> Quick Tip:
> Check the developer's wallet history on Axiom Pro. A dev with multiple abandoned or rugged projects is an instant red flag.

🛠️ Technical Warning Signs

- **Sudden Unexplained Wicks:**

  Large spikes or drops in price without news usually mean manipulation.

- **Volume Manipulation:**

  If volume spikes without matching social activity, bots might be pumping the price artificially.

- **Contract Code Issues:**

  Run the contract through rug-check tools. Be wary of unusual functions (like hidden fees or selling restrictions).

  RugCheck - Solana token checker
  Solana token checker
  https://rugcheck.xyz/

- **Liquidity Red Flags:**

  Low liquidity compared to market cap makes manipulation easy. Locked liquidity is safer—unlocked or minimal liquidity is risky.

A typical rug chart with price manipulation on the right (same ammount of buy

> Quick Tip:
>
> If buying is allowed but selling fails—run! Some rug coin freeze your tokens so you cannot sell

📢 Social Media Red Flags

- **Overpromising & Hype:**

  Excessive promises or claims like “guaranteed 100x!” signal desperation, not quality.

- **Copy-Paste Marketing:**

  If their messaging looks like everyone else's, the project likely lacks originality and genuine potential.

- **Communication Issues:**

  Frequent disappearances or irregular updates from the team usually precede rugs.

- **Aggressive Censorship:**

  Legitimate projects welcome questions. Rug teams aggressively delete critical feedback and questions.

📈 Trading Activity Red Flags

- **Early Investor Dumps:**

  Immediate selling by insiders after launch typically indicates a planned rug.

- **Blocked Selling Functions:**

  Check if selling is restricted or blocked by the contract—this is the easiest way devs prevent investors from cashing out.

- **Contract Changes & Taxes:**

  Sudden, unexplained changes in transaction taxes or contract terms typically lead to exit liquidity events.

- **Repeated Failed Breakouts:**

  Continuous failures to maintain gains at key resistance levels often indicate artificial pumps.

Copy and paste any CA in the Rug Check :

RugCheck - Solana token checker

Solana token checker

https://rugcheck.xyz/

🎯 **Rapid Rug-Check System (30-sec)**

Before any trade:

1. ✅ Contract verified?
2. ✅ Liquidity locked or burned?
3. ✅ Top wallet below 20%?
4. ✅ Community growth matches price action?

Remember: No coin is 100% safe. The goal isn't perfection, but finding projects with manageable risk and high reward.

Ressources:

▼ Analysis of a coin checklist

Before entering in a coin you can ask yourself all these questions:

Step 1: Social Media Analysis

Token's Social Presence:

- ☐ Are they actively posting updates about the project?
- ☐ Is the narrative gaining traction or fading out?
- ☐ Are posts generating engagement (likes, comments, retweets)?
- ☐ Is the sentiment bullish or filled with FUD (Fear, Uncertainty, Doubt)?

Developer's Profile:

- ☐ Is the dev active and engaging with the community?
- ☐ Is the team transparent or anonymous? (Most likely anonymous for memes)
- ☐ What's their history—have they launched successful projects before?
- ☐ Are they hyping up the token or staying silent?

Step 2: Community Validation

Community Buzz:

- ☐ Are people talking about the token consistently on social platforms like Twitter ?
- ☐ What's the general sentiment in Telegram groups or community chats?
- ☐ Are influencers or big accounts showing interest in the project?
- ☐ Is the meme going viral beyond crypto Twitter? (Look for TikTok trends or broader engagement)

Step 3: Website & Project Details

Website Quality:

- ☐ Is it professional or just thrown together? Does it look credible?
- ☐ Do they provide a roadmap, whitepaper, or any clear plans for future development?
- ☐ If it's a meme project, does it at least have humor and creativity that stands out?

Step 4: Holder & Wallet Analysis

Holder Distribution:

- ☐ How many holders are there? (More holders = healthier distribution)
- ☐ Do any wallets own more than 3% of the supply? (Avoid concentrated holdings)
- ☐ Are there wallet clusters indicating insider manipulation? (Use tools like BubbleMaps)
- ☐ Is holder count increasing (positive signal) or decreasing?

Step 5: Trading Activity

Volume & Liquidity:

- ☐ Is trading volume increasing steadily or spiking artificially?
- ☐ Was liquidity locked, and if so, how much? (Locked liquidity = less chance of rug pull)

- ☐ Are there signs of bot-driven volume manipulation?

Whale Movements:

- ☐ Have whales started accumulating this token recently?
- ☐ Are there big buys happening, or is it mostly retail activity?

Step 6: Insider Activity

Top Trader Behavior:

- ☐ Did top traders actually buy this token, or are they avoiding it?
- ☐ Are top traders still holding their positions? If yes, how much are they holding?
- ☐ Did insiders front-run the launch and sell off immediately?

Step 7: Red Flags to Watch Out For

Common Warning Signs:

- ☐ Sudden large wicks without explanation
- ☐ Artificially inflated volume with no organic growth
- ☐ Lack of transparency around team and roadmap
- ☐ Negative sentiment dominating social channels

Action Items

📍 Complete these before moving to Module 4

📍 These exercises build your analytical skills

📍 Practice makes perfect - don't skip these steps

☐ **Perform a full analysis on 3 different memecoins**: Use the provided checklist to analyze one established coin, one mid-stage coin, and one newly launched coin

☐ **Create your personal red flag scoring system**: Develop a weighted scoring method for the most important warning signs based on your risk tolerance

☐ **Practice detecting wash trading**: Find two examples of suspicious volume patterns on DEX Screener/Axiom and document why they appear manipulated

▼ Summary Module 4 📜

> Thorough analysis is what separates profitable traders from gamblers.
>
> While others buy based on hype or FOMO, you now have a systematic framework to evaluate memecoins objectively.
>
> This module taught you to look beyond price action to the underlying factors that drive sustainable growth: healthy holder distribution, authentic community engagement, smart money involvement, and absence of manipulative practices.
>
> By developing these analytical skills, you'll identify both promising opportunities and dangerous traps before most traders.

3 Key Takeaways 💡

- Holder distribution tells the true story - coins where top wallets own less than 3% each have dramatically higher success rates
- Volume patterns reveal manipulation - natural growth shows steadily increasing volume while artificial pumps show sudden spikes without community growth
- Smart money tracking provides validation - clusters of successful wallets buying is the strongest confirmation signal possible

3 Common Mistakes to Avoid ⚠️

- Skipping liquidity verification - even promising projects can be rug pulls if liquidity isn't locked or burned
- Ignoring red flags because you "like the meme" - emotional attachment leads to poor judgment
- Failing to test the sell function with a small amount - some tokens allow buying but restrict selling

▼ MODULE 5 : Entry & Exit Strategies 🤑

Quick Win Technique:

For your next trade, set these exact take-profit levels: 25% of position at 2x entry, 25% at 3x, 25% at 5x, and a trailing stop for the final 25%.

Input these orders immediately after entry.

This simple technique statistically outperforms both holding and taking full profits at once—and requires zero additional analysis.

MODULE 5 : Entry & Exit Strategies 🤑

If there is one thing you need to know about trading is : BUY RED SELL GREEN - Not the opposite

You need to buy when people are scared, this is how you make money in this game. If you top blast (Buying the top), you're going to take a lot of risk as the coin is most going to retrace at some

points.

💡 I recommand you to switch from display Price to display Market cap when you're trading. it's easier to understands the psycological level

I also recommend you to switch the buy & sell display from USD to SOL to remove the psychological attachement to $

▼ 5.1 - Technical Analysis Fundamentals

📜 > *"Charts tell stories—but only patient traders listen."*

🔥 1. Volume Confirmation (Momentum's Best Friend)

Volume confirms whether price movements are genuine:

- **Rising 5-Minute Volume:** Confirms breakout strength—validates true momentum.
- **Low Volume Moves:** Price changes without volume are often fakeouts or traps.
- **Volume Divergence:** Price rising but volume falling signals potential reversal—stay cautious!

Always remember: **5-minute volume** is your best indicator to catch momentum early.

We already saw that in the previous module. Volume is KING.

Always watch volume

📈 2. Trendlines (Your GPS in Trading)

Trendlines guide your trading path clearly:

- **Upward Trendline (Bullish):** Indicates consistent buying pressure—consider buying dips.
- **Downward Trendline (Bearish):** Signals selling pressure—look to exit or avoid entries.
- **Sideways Trendline (Accumulation):** Market indecision or accumulation before explosive moves (up or down).

Your goal: **Buy at ascending trend bottoms, sell at descending trend tops.**

How to know when the uptrend is going to change ?

You can activate EMA cross in indicators so help you spotting trend changement

- **Recognizing Reversal Patterns**:
  - Double tops: Price attempts new high twice but fail and reject
  - Exhaustion candles: Long wicks at the top of candles
  - Volume decline during price increases (failing buy pressure)

If volume is decreasing it’s probably that the price is about to dump:

Support & Resistance:

Another trading basics that you must know. Trading resistance & support is the little change that can make you a profitable trader.

Prices react predictably at specific levels:

- **Historical Highs/Lows:** Act as natural support and resistance barriers.
- **Round Numbers:** Psychological points where traders instinctively buy/sell (e.g., $100K, $500K, $1M Market Cap).

- **Resistance becomes Support:** After a breakout, previous resistance often flips to support—use this knowledge strategically.

Psychological level can act as well as resistance and support level

Example Psychological Levels:

- 50K MC, 100K MC, 250K MC, 1M MC, etc.

People are most going to buy/sell around these psychological levels.

> 📜 *“The chart speaks—but only those who wait hear it.”*

Pro tip: Activate the volume visible range to see the ammount of buy / sell per level.

this will help you confirm support and resistance

Blue: Buy
Yellow : Sell

🚦 4. Momentum Indicators (Catch the Market's Pulse)

Momentum indicators signal optimal entry and exit points:

- **RSI (Relative Strength Index):** Below 30 signals oversold conditions—potential buy.
- **MACD Crossovers:** Indicate momentum shifts—buy or sell signals.

- **Volume Spikes:** Often precede significant price moves—stay alert!

Pro Tip: MACD is among the simplest and most reliable indicators for momentum confirmation.

RSI show you if the price is overbuy/oversold

MacD is howing you if either the price have more chance to go up or down z

EMA cross as we already saw is to detect trendlines changed

▼ 5.2 - Finding the Best Entry Points (Fibonnaci)

Finding the Best Entry Points

Timing your entry is critical for maximizing profits:

Thanks to fibonnaci we can know where are resistance and support to time out our entry/exit strategies

Resistance & support are taking also in consideration the psychological level so when your fibo support is matching with a psychological support (example : 2M) , you have a double support confirmation

- **Fibonacci Retracement Levels**:
    - The Golden Pocket (0.618-0.65): Highest probability reversal zone after pullbacks
    - 0.5 level: Many algorithms buy here, creating natural support
    - 0.786 level: Last strong support in a correction, ideal for catching bottoms

Forget about technical analyss because reading chart is not what will make you the most successful. Strategy, psychology & Mindset are the ones that will bring you where you want to be .

One of the only technical analyss you will need is knowing how to use properly the Fibonnaci level.

With memecoins, often this coin rest resistance and support, so using fibonnaci will help you a lot understanding that.

Let’s take an example of a bad entry :

Not real good entry for me :

High entry : Risky , the token can dump

Low entry : Risky, the token might never pump again

Fortunately on this one after having done some extra research I was confident so I bought back the dip

Now let’s take an example of a good entry

On this one I followed my strategy an dbought when we’ve been actually going again on the .5 zone

To draw a fibo, click on fib retracement and goes from to of the chart to bottom

The level I used and how to configurate your fibo: (keep.382 activated)

Reminder:

- Find the best entry (use the fibo)
- take your initials out as soon as possible (for example 25% you sell 25% , then at 50% another 25% , etc)
- Keep a Moonbag when you're derisked and take extra profit on the way up

▼ 5.3 - Strategic Profit Taking

Trust me, there is nothing worst than being positive in a trade & end up exiting in a losses.

Everything about this game is to have the most risk free strategy if you want to survive the long term run.

🎯 What is this Scalping Strategy?

It's a **short-term trading technique** aimed at quickly capturing gains in volatile, low-cap memecoins by systematically taking profits at predefined levels.

Imagine scalping like fishing:

- You cast your net (**buy entry**),
- quickly pull out fish (**take profits early**),
- and occasionally let a few smaller fish back into the ocean (**moonbag**) to potentially grow big later.

I like for example taking my initials out as soon as possible. By that I mean at the first pump between 20-50% in general I take out 25% to 50% of my position.

Then I put my stop loss above my entry level. If the coin retrace lower at least i secure my profits and don’t lose money. If the coin goes up I will sell by chunk of 25% at every consequent pump and then leave a moonbag.

Not losing money is MORE important than winning money so alway take your initials out AT LEAST at x2 (take 50% of the position and ride the profit)

Consistent profits require disciplined exits:

- **Rule #1**: Always take your initial investment first
  - Eliminate downside risk while maintaining upside exposure
  - Psychological benefit: Trading with "house money" reduces emotional attachment
- **Clip (Short sell) Strategy**:
  - First clip (25-30%): At 1.5-2x your entry
  - Second clip (25-30%): At 3-4x your entry
  - Third clip (20-25%): At 5-7x your entry
  - Final clip (20-25%): Set stop stop or hold for moonshot

- **Market Cap Milestones**:
  - Small caps (<$1M): Expect high volatility, take profits earlier
  - Mid caps ($1-10M): More stable, can hold longer through pullbacks
  - Large caps (>$10M): Require significant volume for further upside

🔥 Why Does it Work for Low-Cap Memecoins?

  - **Rapid Volatility**: Low-cap coins can quickly pump and dump; locking profits early is crucial.
  - **Emotional Control**: Structured profit-taking reduces impulsive decisions.
  - **Moonbag Mentality**: Keeps potential upside without the anxiety of a large position.
- **Profit-Taking Examples**:

Initial Investment	At 2x	At 3x	At 5x	Final Stop Loss
$100	$50	$50	$75	$75
$500	$250	$250	$375	$375
$1,000	$500	$500	$750	$750

Remember: Entry and exit execution are where most traders fail. Practice these techniques on smaller positions until they become second nature.

Action Items

📍 Complete these before moving to Module 6

📍 These exercises will refine your entry and exit skills

📍 Practice makes perfect - timing is everything in memecoin trading

☐ **Practice identifying Fibonacci retracement levels**: Find 3 recent memecoin pumps and mark the 0.618, 0.5, and 0.786 levels to see where reversals occurred

☐ **Create your personalized profit-taking plan**: Document your exact exit strategy with percentage targets for different types of trades

☐ **Set up a demo trade with staged exits**: Paper trade a memecoin using the 25% exit strategy at predefined targets

☐ **Build a position sizing calculator**: Create a simple spreadsheet that calculates your maximum position size based on portfolio value and risk tolerance

☐ **Identify 5 topping patterns**: Find examples of double tops, exhaustion candles, and volume divergence in recent memecoin charts

▼ Summary Module 5 📜

> Mastering entry and exit points is what ultimately determines your profitability in memecoin trading.
>
> While others buy randomly and hold indefinitely, you now have a structured approach to timing your trades and securing profits.
>
> This module equipped you with tools to identify optimal entry points using Fibonacci retracement levels, confirm movements with volume analysis, and protect your capital through strategic profit-taking.
>
> Remember that discipline in executing your exit strategy is even more important than finding the right coins to buy.

3 Key Takeaways 💡

- The Golden Pocket (0.618-0.65 Fibonacci level) provides the highest probability entry point during pullbacks in uptrending markets
- Volume confirmation is essential - price movements without corresponding volume changes are unreliable signals
- Staged profit-taking (25% at predetermined targets) is the most effective way to balance between securing gains and capturing upside

3 Common Mistakes to Avoid ⚠️

- Waiting for the "perfect" entry point and missing good opportunities - better to scale in at different levels
- Failing to take profits according to plan when targets are reached due to greed or FOMO
- Risking too much on a single trade (>2% of portfolio) regardless of conviction level

Next Challenge:

In Module 6 & 7, you'll learn critical risk management strategies and psychological techniques to maintain discipline during emotional market conditions.

The entry and exit skills from this module will serve as the foundation for developing a sustainable trading business.

▼ MODULE 6 : Risk Management 🎲

Quick Win Technique:

Take 1 minutes now to set up your multi-wallet system:

Create separate Phantom wallets for trading (Trench), long-term holds, and capital preservation (vault stablecoins).

This is where you win. Having a good risk management strategy is the KEY to succeed with memecoins.

With no risk management strategy you can make good money but will end up losing everything.

MODULE 6 : Risk Management 🎲

▼ 6.1 - The Multi-Wallet System 🔄

Protect your capital with this strategic wallet structure:

Your risk management start by having a clear strategy with different wallets.

I don’t recommend buying good coins dip with your initials capital but rather with your trench profit (trenching = trading low cap coins).

with this method you don’t expose yourself to any downside if the coin drop.

- **Trench Wallet** 🪖 : For active trading (high-risk, high-reward)
  - Only fund with money you can afford to lose
  - Exit initial investment between 20-100% when profitable
  - Keep this wallet size manageable (prevents emotional decisions)

- **Hold Wallet** 🚀 : For quality projects you believe in
  - Store convictions "moonbags" from successful trades here
  - Buy dips of strong projects using trench wallet profits
  - Never touch this capital for active trading

- **Vault Wallet** 🔐 : For capital preservation and passive income
  - Store USDC and stablecoins here
  - Consider yield farming or staking for additional returns
  - Keep funds liquid in bull markets, locked in bear markets
  - Target allocation: 20-30% of total trading capital

- **Reload Wallet** 🔋 : Emergency capital reserve
  - Use only IF trench wallet is depleted
  - Prevents emotional deposits after losses
  - Replenish from profits during successful periods
  - Recommended size: Equal to your trench wallet

Example of strategy

1. Initial Setup

- **80% of capital**: Split between Trench (active trading) and Reload (reserve)
- **20% of capital**: Goes directly to Vault Wallet for preservation

2. Trading Process

- **Trade only with Trench Wallet** (example: 10 SOL)
- **IF Trench is depleted**, refill from Reload (example: another 10 SOL)
- **Hold Wallet starts empty** and is built solely from profits

3. Profit Distribution

- When you make profitable trades:
  - Take initial investment back to Trench Wallet
  - Split remaining profits: Example: 25% to Hold, 75% to Vault

Example with Numbers:

1. Start with 10 SOL total
   - 8 SOL for trading (4 SOL in Trench, 4 SOL in Reload)
   - 2 SOL in Vault for preservation
2. Make a successful trade in Trench:
   - 1 SOL trade becomes 3 SOL (2 SOL profit)
   - Return 1 SOL to Trench Wallet
   - Remaining 2 SOL profit split:
     - .5 SOL (25%) goes to Hold Wallet
     - 1.5 SOL (75%) goest to Vault Wallet

▼ 6.2 - Risk / Reward Ratio

“Trading without knowing your risk is like driving blindfolded—thrilling until it isn’t.”

🧠 **What Is Risk-to-Reward?**

Risk-to-reward ratio helps you measure if a trade is worth the gamble.

- **Risk:** How much you might lose if the trade goes wrong.
- **Reward:** How much you could win if it goes your way.

A **good trade** means the potential reward is much higher than the risk.

🍌 **Easy Example: The Banana Bet**

- Imagine betting 1 banana 🍌 with your friend on a coin flip.
- If you win, you get **3 bananas** 🍌🍌🍌.
- If you lose, you only lose **1 banana** 🍌.

Your **risk-to-reward ratio** is **1:3**. You risk 1 banana to gain 3.

📈 Applying This in Memecoin Trading

Always aim for at least a **1:2 ratio or better** in memecoin trades.

- Example: You risk losing **$50** to potentially make **$100**. (Risk:Reward = 1:2)

This way, even if you lose half your trades, you still stay profitable.

🚩 Why High Risk-to-Reward Matters

- **Low ratios (1:1):** You must win most of your trades to stay profitable (dangerous!).
- **Higher ratios (1:3 or better):** Even a few wins cover multiple losses, giving you room to breathe.

Remember: **You don't need perfect accuracy; you need good odds.**

📌 Quick Risk Checklist

Before you enter any trade, ask yourself:

- ✅ What's my maximum loss (risk)?
- ✅ What's my potential gain (reward)?
- ✅ Is the reward at least twice my risk?

If yes, you're clear to enter. If no, reconsider—this isn't a casino, it's trading.

🐵 **Pro Tip:**

Always look for trades with asymmetric risks. Small downside, huge upside = jackpot territory.

▼ 6.3 - Position Sizing Strategy

Your position size determines your risk exposure:

- **The 1-2% Rule**:
  - Never risk more than 1-2% of your total portfolio on a single trade
  - Adjust position size based on conviction level (lower for pure gambles)
  - Calculate maximum position size before entering trades

Your sizing will also depend on your personnal risk tolerance.

I'm very tolerant to risk but depending your personality this might be different.

- Convictions levels

I rate my trade with conviction level and plane my risk according to it.

If my normal buy in is 1 SOL, I will only enter with 1 SOL at level 3

> Level 1 = Pure gamble extremely risky 💎
> (25% size)

> Level 2 = Can be something 💎 💎
> (50% size)

> Level 3 = Good coin 💎 💎 💎
> (100% size)

> Level 4 = Banger 💎 💎 💎 💎
> (200% size)

- **Scaling Into Positions**:
  - Start with 30-50% of planned position size
  - Add on confirmation (e.g., successful retest of support)
  - This reduces risk while maintaining upside exposure

Another technic would be to DCA your sizing into 2 - 4 buys instead of 1

Example : 1 SOL is normal buy in = 2 buy in of .5 SOL = 4 buy in of .25 SOL

▼ 6.4 - Paper trading

You're now almost ready to trade.

The ultimate step now is to try out your strategy on paper trading

Paper trading is just a fancy word for saying fake trading.

You take a pen & paper and write down the trade with your entry and exit level.

like this you can calculate your score/win rates & build your strategy on top of that.

I would advise you to wait for you to reach 50-75%+ winrate before entering with real money.

After that, when you will trade with real money you will start being affected by emotions & psychology. That's why paper trading is not enough to learn so you can start playing with a little ammount of money for the first trade to start understans this mental game.

Then you'llbe ready for the next module about the mindset

Action Items

📍 Complete these before moving to the Psychology module

📍 These activities will establish your risk management infrastructure

📍 Proper setup now prevents devastating losses later

☐ **Set up your multi-wallet system**: Create separate wallets for Trench, Hold, Vault, and Reload functions with proper security for each

☐ **Allocate your capital**: Distribute your funds according to the recommended percentages (5-10% Trench, 30-40% Hold, 40-50% Vault)

☐ **Create your profit distribution flowchart**: Document exactly how profits from successful trades will flow between wallets

☐ **Build a profit-taking calculator**: Create a spreadsheet that automatically calculates your exit points based on initial investment

☐ **Practice the "house money" technique**: Execute a small trade and immediately remove your initial investment once profitable

▼ Summary Module 6 📜

> Risk management is the foundation of successful trading.
>
> While most traders focus exclusively on finding opportunities, professionals know that protecting capital is equally important.
>
> This module introduced you to the multi-wallet system and strategic profit-taking framework that professional traders use to survive market volatility and compound gains over time.
>
> By structuring your capital properly and having predetermined exit strategies, you'll avoid the catastrophic losses that eliminate most traders from the market.

3 Key Takeaways 💡

- The multi-wallet system creates psychological barriers that prevent emotional decision-making during market volatility

- Always taking your initial investment off the table transforms the risk profile of your trades and enables more rational decision-making
- Strategic profit-taking in stages (the clip strategy) balances between capturing upside and securing profits, outperforming both early and late exits

3 Common Mistakes to Avoid ⚠️

- Keeping all your capital in a single wallet, which leads to poor risk management and emotional trading
- Failing to extract your initial investment early, leaving your entire position at risk
- Using ad-hoc profit-taking decisions rather than predetermined exit points, resulting in emotional rather than strategic exits

Next Challenge:

In the Psychology module, you'll learn how to manage the emotional aspects of trading that often override even the best risk management systems. The wallet structure and profit-taking framework from this module provide the foundation for maintaining discipline during market volatility.

▼ MODULE 7 : Psychology 🧠

Quick Win Technique:

Before your next trade, write down your entry price, target exits, and maximum loss tolerance.

Then ask: "If this trade loses the maximum amount I've specified, how will I feel?"

Rate that feeling 1-10. If it's above 7, reduce your position size immediately.

This simple check prevents emotional trading decisions and significantly improves results.

MODULE 7 : Psychology 🧠

▼ 7.1 - Psychological Biases & Remedies

> "In trading, your greatest enemy isn’t the market—it’s your mind."

Master your psychology to unlock consistent profits. Here's how to identify and defeat common trading biases:

🚩 1. Loss Aversion Bias

- **Symptom:** Holding losing trades too long, but selling winners prematurely.
- **Remedy:** Establish **strict predetermined exit points** before you enter any position.
  - **Implementation:** Write down your exit points explicitly.
    - *Example:* "Exit 100% if price drops 20% below entry."

🚨 2. FOMO (Fear of Missing Out)

- **Symptom:** Chasing coins at local tops due to emotional hype or pressure.
- **Remedy:** Maintain a **Trading Journal** to capture emotions at each trade entry and exit.
  - **Practical Steps:**
    - Rate your FOMO level (1-10) before every trade. Avoid trading if your rating is above 7.
    - Enforce a minimum **6-hour cool-down period** before entering a hyped coin.
  - **Self-check question:** *"Am I buying based on analysis or simply because everyone else is?"*

⚓ 3. Anchoring Bias

- **Symptom:** Fixating on your original entry price rather than adapting to the current market reality.
- **Remedy:** Regularly reevaluate your positions objectively.
  - **Implementation Technique:** Every 24 hours, perform this mental reset:
    - Ask yourself: *"If I just found this token today, would I still buy it at the current price?"*
    - Set daily calendar reminders to force regular position assessments.

🔍 4. Confirmation Bias

- **Symptom:** Only seeking information that confirms your existing trade positions or beliefs.
- **Remedy:** Actively challenge your viewpoint.
  - **Action Steps:**
    - For every bullish signal, deliberately search for at least one bearish signal.
    - Employ a **"Red Team" Approach:** Before significant trades, have a trusted trading partner critique your analysis to reveal blind spots.

▼ 7.2 - The Psychology of Successful Traders

> "Markets don't differentiate traders—mindsets do."

Understanding and mastering trader psychology is your strongest edge:

🎯 Process vs. Outcome Focus

- **Amateur Traders**: Fixate solely on outcomes (profits and losses).
- **Professional Traders**: Focus strictly on process (executing their trading plan flawlessly).

Key mindset shift:

- Evaluate your trading success based on **how well you followed your rules**, not on individual trade results.
- Trust your process—over time, disciplined execution always wins.

🔥 Emotional Discipline Techniques

1. **The 1-Hour Rule**:
   - Wait **at least 1 hour** before acting on emotionally driven trade decisions.
2. **Journal Reviews**:
   - Conduct **weekly reviews** of your trading journal.
   - Identify recurring emotional triggers and patterns to refine your emotional responses.
3. **Daily Meditation (5-10 minutes)**:
   - Regular meditation strengthens emotional control and sharpens focus.£
4. **Physical Separation**:
   - Physically step away from your trading setup during periods of intense stress or frustration.

▼ 7.3 - - Your broke mindset vs Trader Mindset

MINDSET

Broke Mindset vs. Trader Mindset

Trading psychology determines your results:

- **Broke Mindset Traits**:
  - Scarcity thinking: "I need to make money now or never"
- **Trader Mindset Traits**:
  - Abundance thinking: "There's always another opportunity"

- Emotional decision-making during volatility
- Chasing losses through revenge trading
- sOversizing positions due to desperation
- Self-sabotage: "I don't deserve big wins" limiting belief

- Process-oriented rather than outcome-focused
- Accepting losses as cost of doing business
- Consistent position sizing regardless of emotions
- Long-term perspective: Building wealth vs. getting rich quick

- **Mindset Transformation Techniques**:
  1. Create a "Missed Opportunities" journal to prove new chances always appear
2. Develop a detailed trading plan with specific rules before market opens
3. Separate trading results from self-worth through affirmations
4. Visualize losing trades as necessary "education payments" for trading education

——-

If you end up loosing money more than you make with Memecoins it’s probably that you have a broke mindset.

Being broke is a disease of the mind, and you need to actually start thinking differently if you want to be successful at trading memes.

A scarcity mindset will make you do emotional decisions that will lead you to failure.

Revenge trading, oversizing , overtrading , etc

I’ve been through that so that’s why I know.

I’m originally from a “poor” family and grew up with this mindset. Everybody in the village was the same. No ambition , no dreams, no millionnaire mindset.

You need to change your mind if you want to start making money in this game.

From the chimp to the gorilla.

From the pup to the wolf,

From the chicken to the raptor.

I believe that people who lost the most on memecoins here come with low money and I hope to end up burning everything.

If you don’t want to end up like this, you need to actually hack your brain and changed your identity.

→ Reprogramming Limiting Believe

→ Building self-confidence

→ Learn about money

Do you know what’s money ? If you’re still broke, it’s probably because you have a scarcity mindset. If it’s the case, this is what lead you to fail again and again and again.

Here is the method to break free from that mindset:

Money is a currency to exchange value.

Most of people exchange time for money so they value money as an important thing while it’s not. Money it’s not real.

If you want to be successful in memescoins trading you need to remove the emotions from your trades and by changing your mindset you actually changes your trading habits & results.

You can create the life that you want. Most of you will fail because you create yourself a miserable life. If you're still chasing money and you're broke it mean that you need to start thinking positive and visualise your dream life.

I know it sounds stupid and if you have something telling you in your head to don't do that it's probably that you need it.

95% of our life is managed by our subconscious and most of your actions are too. Your subconscious takes most of your decisions and because of your broke mindset, you're going to take bad decisions.

To start changing this you will need to put a bit of effort but trust me. IT worth it. when you really do the work you will see your life start changing slowly day after day.

The process is deconstructed in a few steps:

- Vision board, clear visions & goal
- Writing down your limiting believes and replace them
- Visualizing your dream life every day for at least 10 min

1 - Vision Board & clear vision:

Open Canva, start browsing google and copy and paste image of what you want in your life.

If money is important for you ask yourself why do you need this money ? Is it for yourself ? to help your family ?

Write all this down

Then start writing your vision :

- your goal in life
- What you see yourself in 1, 5 , 10 years
- What do you want in your life

for me for example, I want to live a life of freedom.

Money help me to buy this freedom, money is a tool.

Money allows me to travel everywhere in the world without stressing , having a 9-5 job and working from somewhere is something that I too important for me. I want to live a life of well-being , taking care of myself, being able to go to the spa often ,etc “

---

2 - Writing down your limiting believe

You probably have your brain full of limiting believe about money and you need to identify them

Take a note pad or document and start writing down all the limiting believe you can have about money that people put in your head over the years

Some example

You need to work hard to get money

I’m scared of loosing my money

I don’t deserve success

I don’t know how to do it

Money is the root of evil

Money is scarce

Write down EVERYTHING

Then for each believe answer to the following questions :

- It's likely that I won't be able to achieve this vision because ...
- I have this belief because ...
- This belief and the elements on which it is based could be false because ...
  Instead, a more positive belief would be that ...
- This belief is true because ...

You need to identify ALL these believes in your brain and go through this process

then you have the 3rd step

Now that you have your vision writen down, your vision board, you identified and reprogrammed your limiting believes

It’s time to create your dream life now.

If you’re new to visualisation, i recommend you to write down some scneario of your dream life.

For example : Imagine you’re watching the movie of your best life, how it would look like ? Where do you live ? Who are your friend ? What’s your personalities ? Qualities ?

What people think about yo ?

Actually you can create whatever you want. Then you need to start visualising this EVERYDAY. When you wake up & before you sleep at least.

Close your eyes, take long breathe inside for 8 second, Hold a few seconds then breathe out for a few seconds again

Once you’re ready you can actually start visualising your dream life , It’s a bit weird if it’s the first time but you will see it’s like going to the gym it’s going to be better and better day after day

If you want a luxury life with lambo, vizualize it. How it will be when you will be there ?

The cool thing with the subconcisous it’s it doesn’t understand the difference between true of false.

Which mean that by visualising you’re actually creating more and more of this experience and the subconscious will find for you best way to reach that.

During your visualization, you can do some affirmations.

You need to really feels emotions in the visualisation to make it work.

▼ 7.4 - Recovery after losses

🚑 Recovery After Losses (Bounce Back Stronger)

Losses are inevitable—even top traders face drawdowns. How you respond defines your long-term success:

1. The 24-Hour Rule:

- After significant losses (more than 5% of your portfolio), take a mandatory **24-hour trading break**:
  - No trading, no charts, no adjustments.
  - Reflect objectively and emotionally reset.

2. Position Sizing Reset:

- After experiencing losses, reduce your risk exposure:
  - Return to **1% risk per trade** immediately after losses.
  - Gradually increase risk only after regaining confidence.
  - Set clear criteria, e.g., "Increase risk to 1.5% only after 3 consecutive successful trades."

3. Deep Journal Analysis:

- Review losses objectively to pinpoint patterns:
  - Classify each loss:
    - Strategy error?
    - Execution mistake?
    - Bad luck?
  - Identify correlations with emotions, trading hours, or external stressors.
- Ask yourself: *"What would I do differently with perfect hindsight?"*

4. Mental Reset Techniques:

- **Meditation (10 mins):** Use guided breathing techniques to center your mind.
- **Physical Exercise:** Clears stress hormones, revitalizes energy.
- **Positive Visualization:** Imagine flawlessly following your strategy to reinforce positive behavior.

- **Environmental Shift:** Trade from a new location or workspace after significant losses to refresh your mindset.

▼

Action Items

📍 Complete these before moving to the next module

📍 These exercises strengthen your psychological resilience

📍 Mental preparation is as important as technical knowledge

☐ **Create your trading psychology journal**: Set up a dedicated section to record emotional states during trades

☐ **Conduct a "broke mindset" audit**: Identify and document your scarcity-based thought patterns and limiting beliefs about money

☐ **Develop a post-loss recovery plan**: Write specific steps you'll take after losses (24-hour break, position reset, analysis)

☐ **Practice bias identification**: Record 5 recent trading decisions and identify which psychological biases influenced them

☐ **Implement the "contradictory evidence" technique**: For your next 3 trade ideas, force yourself to list 3 strong counterarguments

▼ Summary of the module:

> Trading psychology often determines success more than technical knowledge.
>
> This module exposed the hidden biases and thought patterns that sabotage even technically sound traders.
>
> By understanding loss aversion, FOMO, anchoring, and confirmation bias, you'll recognize when psychology is overriding your trading system.
>
> The difference between broke and trader mindsets revealed how thought patterns directly impact trading decisions.

> Most importantly, you learned practical techniques to build psychological resilience and recover effectively from inevitable losses.

3 Key Takeaways 💡

- Every trading decision is influenced by psychological biases; awareness of these biases is the first step toward neutralizing them
- Transforming from a scarcity mindset to an abundance mindset fundamentally changes how you approach the market and handle volatility
- Implementing specific recovery techniques after losses (24-hour rule, position sizing reset, journaling) accelerates your return to peak performance

3 Common Mistakes to Avoid ⚠️

- Ignoring the emotional component of trading and believing technical analysis alone is sufficient
- Failing to separate self-worth from trading outcomes, leading to destructive emotional cycles
- Attempting to trade through periods of high emotional distress instead of implementing the 24-hour rule

Next Challenge:

In the next module, you'll learn advanced trading techniques that build upon both your technical knowledge and psychological preparation. The mental discipline developed in this module will allow you to execute these advanced strategies with confidence and consistency
.

▼ MODULE 8 : Long term & Advanced Strategies *(soon)*

Building Your Trading Business

Trading Journal Systems

- Create a detailed log of every trade:
  - Entry and exit points

    - Position size
    - Reasoning behind the trade
    - Emotional state during decision-making
- Use spreadsheets or specialized journaling software
- Review journal regularly to identify patterns and areas for improvement

Performance Tracking and Analysis

- Calculate key metrics:
    - Win rate
    - Average win vs. average loss
    - Sharpe ratio (risk-adjusted returns)
    - Maximum drawdown
- Use tools like Excel or TradingView to visualize performance
- Conduct monthly and quarterly reviews to assess strategy effectiveness

Scaling Your Capital Safely

- Increase position sizes gradually as your account grows
- Maintain consistent risk percentages (1-2% per trade) even as capital increases
- Diversify across multiple strategies and assets as you scale
- Consider using a portion of profits to build a "risk-free" trading account

Continuous Education and Improvement

- Stay updated on market trends and new trading techniques
- Attend crypto trading webinars and conferences
- Join trading communities for peer learning and support
- Regularly backtest and optimize your strategies

Building a Support Network

- Connect with other successful traders for mentorship
- Consider joining or creating a mastermind group
- Engage with your audience if you decide to share your journey publicly

Remember: Treating your trading as a business requires discipline, organization, and a long-term perspective. Focus on consistent improvement rather than chasing quick gains.

Join the tribe

BONUS

▼ GLOSSARY 📓

- Degen = Risky Trader
- Cabal = Pump & dump group
- CTO = Community Takeover
- Trenching = Trading low cap coins
- Moonbag = Remaining profits that you hold to moon or dust
- **Round Trip** – Buying high, holding, and selling low… completing the loop of pain.
- **Exit Liquidity** – Traders who buy the top, allowing earlier buyers (often the cabal) to exit with profits.
- **Wagmi / Ngmi** – “We’re all gonna make it” vs. “Not gonna make it” – used to describe good or poor trades.

- **BTFD** – “Buy the f*cking dip” – a rallying cry during a correction.
- **Frontrun** – Buying before a big move, often with insider info or watching smart wallets.

- **Rugpull** – When devs or insiders pull liquidity, killing the project and leaving holders with worthless tokens.
- **Whale** – A trader with massive capital who can move markets, create hype, or dump on others.
- **Rekt** – Losing big on a trade, often due to greed or poor risk management.
- **Bagholder** – Someone stuck holding a token that has dumped significantly.
- **Slippage** – The difference between expected and executed price, worse in low-liquidity trenches.
- **Liquidity Snipe** – Buying a coin the second liquidity is added, usually by bots or pros
- **Lore** – The backstory or meme theme behind a coin, often used to drive community engagement.
- **Cult Coin** – A memecoin with a tight, loyal community and low attention from the mainstream.
- **Narrative Rotation** – When traders move from one theme or meme to another (e.g. dogs → frogs → anime).
- **Viral Loop** – When memes, engagement, and price action feed each other to go parabolic.
- **Soft Rug** – When the dev stops building or marketing, leaving the project to fade without an official rug.

▼ FAQ 🤔

▼ How to LOSE trading memecoins

I Lost 5 figures in the process of learning memecoins.

I don’t want you to be the same.

Here is the biggest mistakes I ever did :

1 - Oversizing your trade:

You have Let’s say 1 SOL bankroll.

Put all your 1 SOL (or a large %) in one single trade is going to lead you to fail 99% of the time I did this mistakes many many times.

If you have 1 SOL, you should use .01 to .05 max (aim for 1 to 3% of your bankroll per trade -

5% max for conviction play) If you want to play it safe. If you want to play it high risk high rewards you can size up bigger but never ever put more than 50% un

With more money you will make money faster but also lose money faster. Especially in the learning process

Like this you can take a lot of trade without having your balance moving too much

Also most of the people (I was like this), ape everything in one coin then don't have liquidity to buy other opportunities

2 - Buy Back your loss

You buy a coin and 30 sec later the coin dropped 35%

then you buy the dip

Then the dip goes deeper , and you buy again the dip

then it goes deeper, you still put more money thinking how rich you will be when the coin will pump.

Surprise: the coin will never pump again.

This happened 99% when you play the right side of the curve.

It's okay to buy back dip but my rules now is never buy back more than 50% of your initials and only if there is 35% dip minimum and only on very convictions plays

3 - FOMO & Top Blasting

You found a coin pumping a lot, people get crazy about it , you see it on twitter , everywhere

You decided to APE at ATH and …. BOOM - 70% down

Always find a good entry in your trade,

If the coin has momentum, wait for the next dip to buy in

4- Revenge Trading

You just aped too much in a coin and got your loss. Then you're thinkin about make this money back.

If you're in this mindset, stop trading and walk away outside. I lost SO MUCH by revenge trading

5- Emotional Trading (often when oversized)

6- Not doing my own research

I've been following many calls where I just got farmed : They call a coin , hype you up for you to buy and sell on your back.

This happened to me many times ! I fomo and entered in the trade without doing any more research.

Most of the time you can buy (to get a good entry when momentum) then directly starting to do research :

- People talk about it on twitter?
- What's the narrative of the coin ? Why people would buy this
- Is there a risk of rug pulls ? (check bundles, top holders, insiders etc)

If a coin is legit & especially if there is a strong community around it, there is high chance that the coin goes higher

7- Doing copytrading

Copy trading will kill your 9 times on 10.

People you copy trade have often a bigger bankroll than you & can afford more lose than you can

Often, you don't know if they will hold the coin or just a short term.

Even tho I made good money with copytrading I ended up losing much more than what I've put initially

In my opinion, the only way to do copytrading is doing it when you're asleep and allocate a very low % of your bankroll to avoid being burned and maximize your chance to get early on a token

Allocate a low ammount per trade (way less than what you put in your own trade)

8- Roundtripping

Something that happened to me many times is roundtripping :

You enter in a coin pre pump, the coin get hype and everybody start talking about it

you’re 10X already but you’re sure the coin is goign to go higher.

Then you wait, the coin dump, you wait more , then the coin died

You could have make it with a lof of profits but your greed got you over/

Always takes profits on the way !!!

10 - Overtrading & Forcing Trades

💀 **Mistake:**

You feel like you "must" trade every day, even when **there's no good setup**. Overtrading kills bankrolls.

✅ **Solution:**

- **Less is more**—take only **high-probability trades**.
- Have a **daily trading limit** (example: max **5 trades per day**).
- **If you lose 3 trades in a row → STOP trading for the day.**

-

11 - Not Understanding the Whale Game

💀 **Mistake:**

You buy a coin, and suddenly **a whale dumps on you**. The price tanks, you panic-sell, and then… it pumps again. **You just got farmed.**

✅ **Solution:**

- **Use tools like BullX, Toxi, Nova** to track **whale wallets**.
- **Check top holders before buying.**
  - If **one whale holds >10-15% of supply**, be careful.
  - If there are **many small holders**, it's healthier.
- **Watch their moves**—if whales **are still buying**, it's a good sign. If they're **slowly selling**, prepare to exit.

13 - Buying Coins Without a Narrative (No Catalyst = No Pump)

💀 **Mistake:**

You buy random memecoins **without understanding why people would buy it too**. If there's no strong narrative, it won't get traction.

✅ **Solution:**

Before buying, ask:

- **What's the meme?** Is it trending or just random?
- **Is there a story behind it?** (Ex: "TRUMP" coin was hyped because of politics.)

- **Does it have social momentum?** (Check Twitter, Telegram, Discord.)
- **Are influencers talking about it?** (If yes, early = good, late = bad.)

A coin with **a strong narrative can pump hard** even if the fundamentals are bad.

---

14 - Relying Only on Calls & Not Building Your Own System

💀 **Mistake:**

You depend **only** on calls from others **without understanding why they enter/exit.** Eventually, you get farmed.

✅ **Solution:**

- Use **calls as confirmation**, but **always do your own research (DYOR)**.
- **Find your own trading style** → Sniping, trend following, whale watching, etc.
- **Keep a trading journal** → Write down **why** you took a trade and **review it later**.

---

15 - Not Using a Stop-Loss or Risk Management Strategy

💀 **Mistake:**

- Holding a coin even after a **50% dump** hoping it will recover.
- Adding **more money into a losing trade** instead of cutting losses.

✅ **Solution:**

- Use a **mental stop-loss** (Example: if a coin drops **more than -30%**, exit immediately).
- Never add more than **50% of your initial** in a dip.
- Accept **small losses fast** so you don't take **huge losses later**.

---

15 - Not Holding enough

- If the coin is good why are you selling to rotate this into another coin ?

  Sometimes you need to be patient for a few hours, days or weeks.

If the narrative around the coin is good and no pump yet, there is a chance you're early enough to be able to live the pump.

Sometimes you need to hold in this market (but always take profits on the way up)
